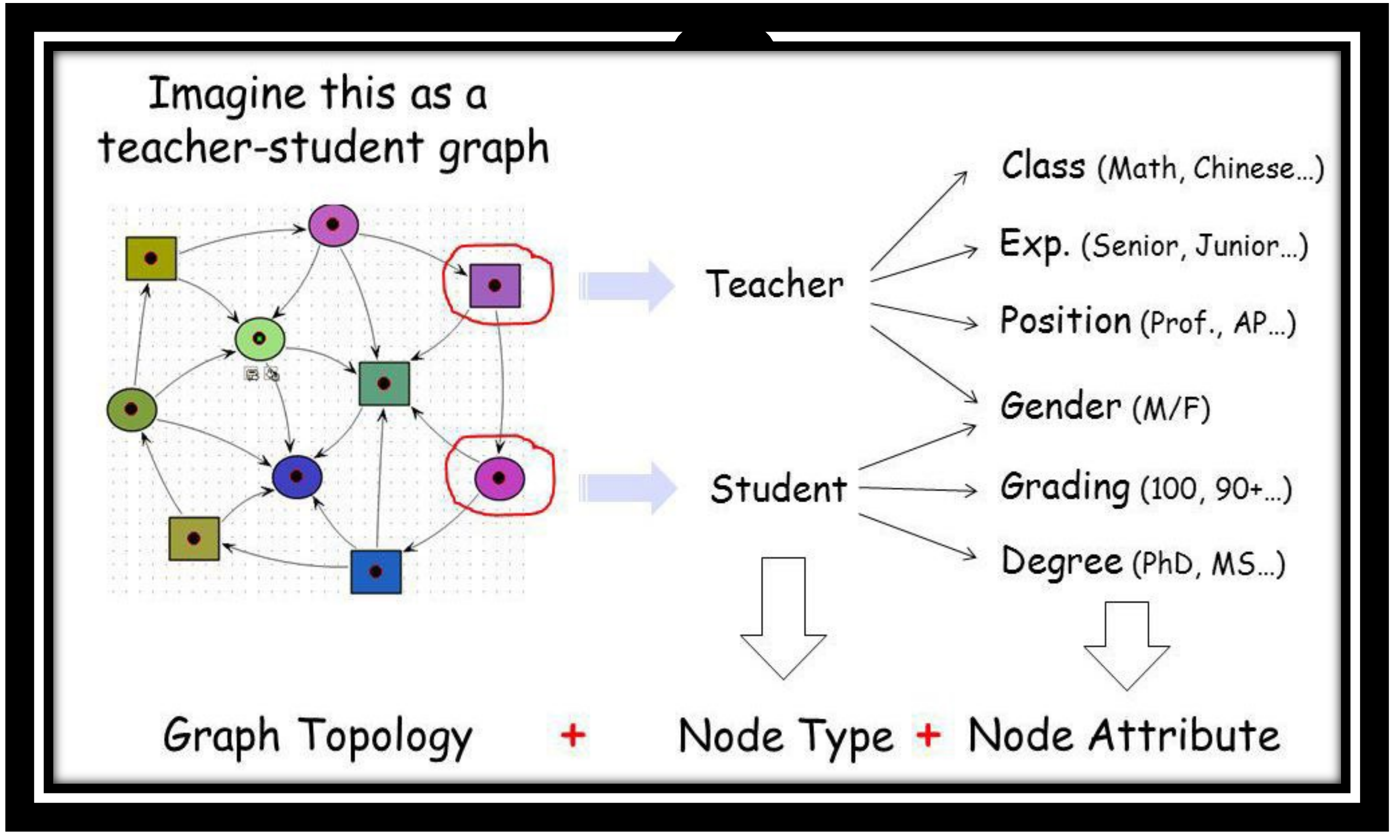
DLG4NLP Demos
DLG4NLP Introduction, Foundations, Applications

Graph4NLP

DLG4NLP Introduction

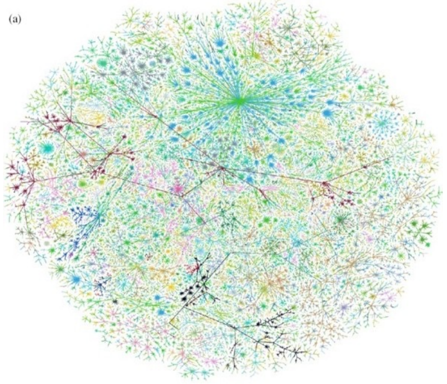
Why graphs?

- Graphs are a general language for describing and modeling complex systems

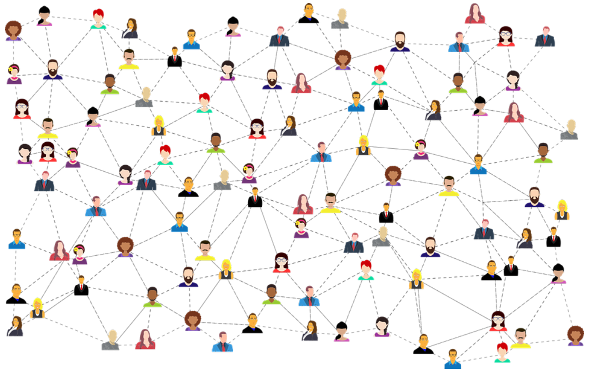


Graph!

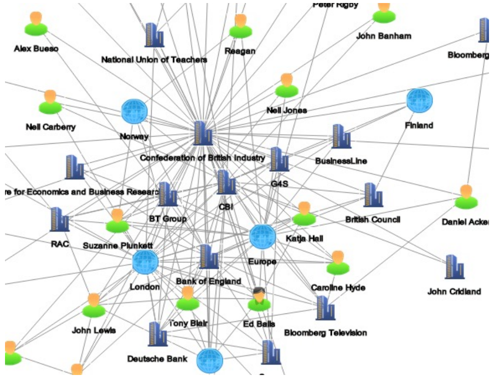
Graph-structured data are ubiquitous



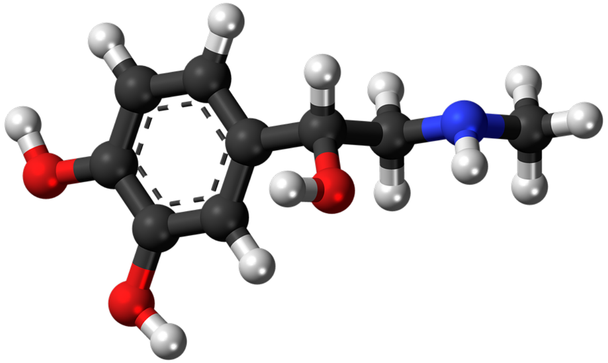
Internet



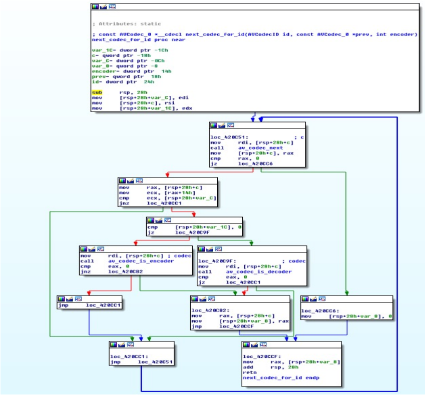
Social networks



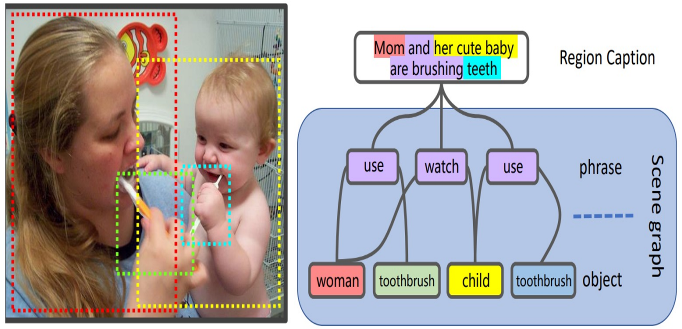
Financial transactions



Biomedical graphs

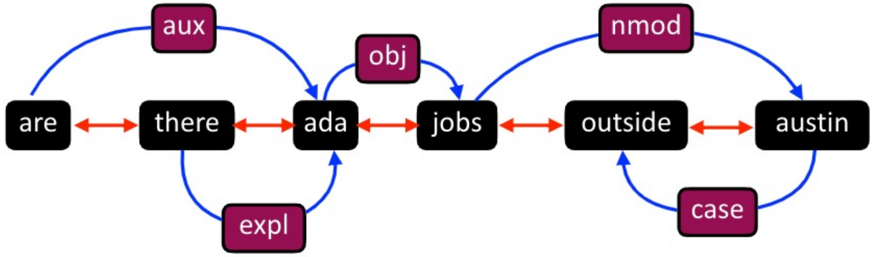


Program graphs

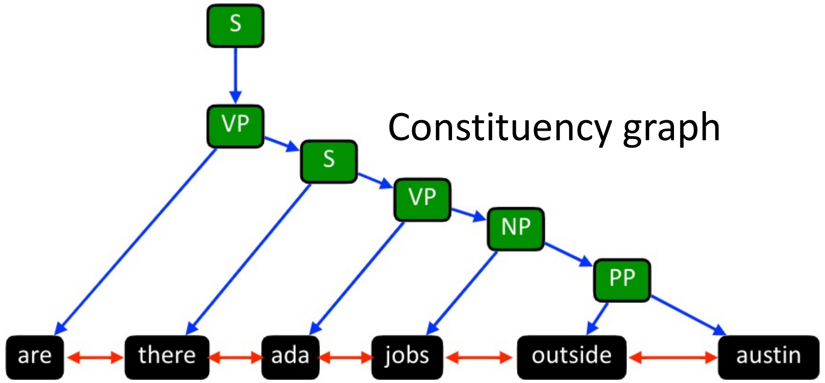


Scene graphs

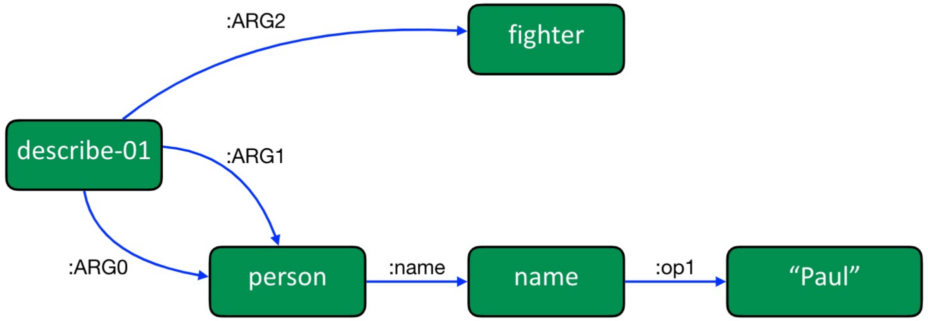
Graphs are ubiquitous in NLP As Well



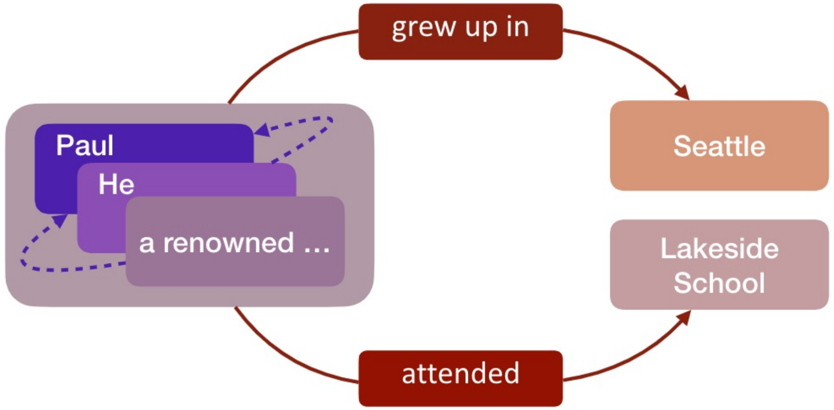
Dependency graph



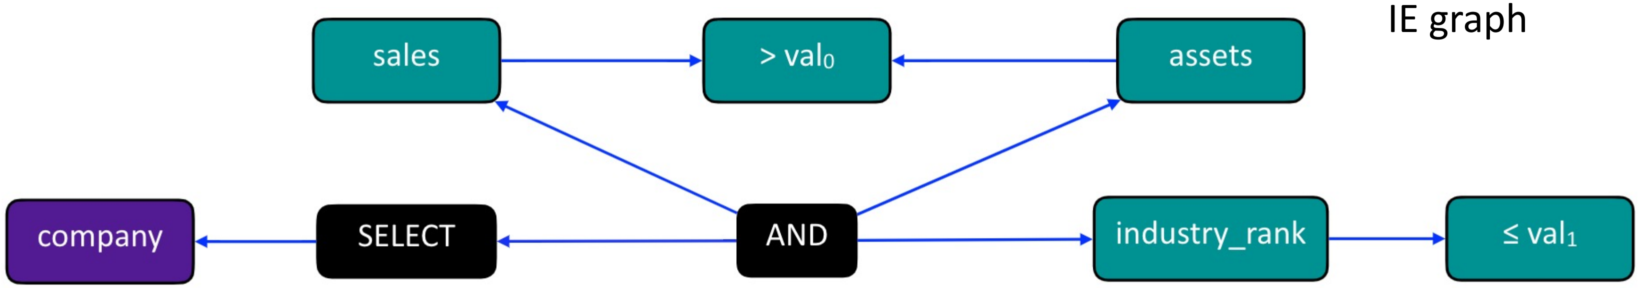
Constituency graph



AMR graph



IE graph

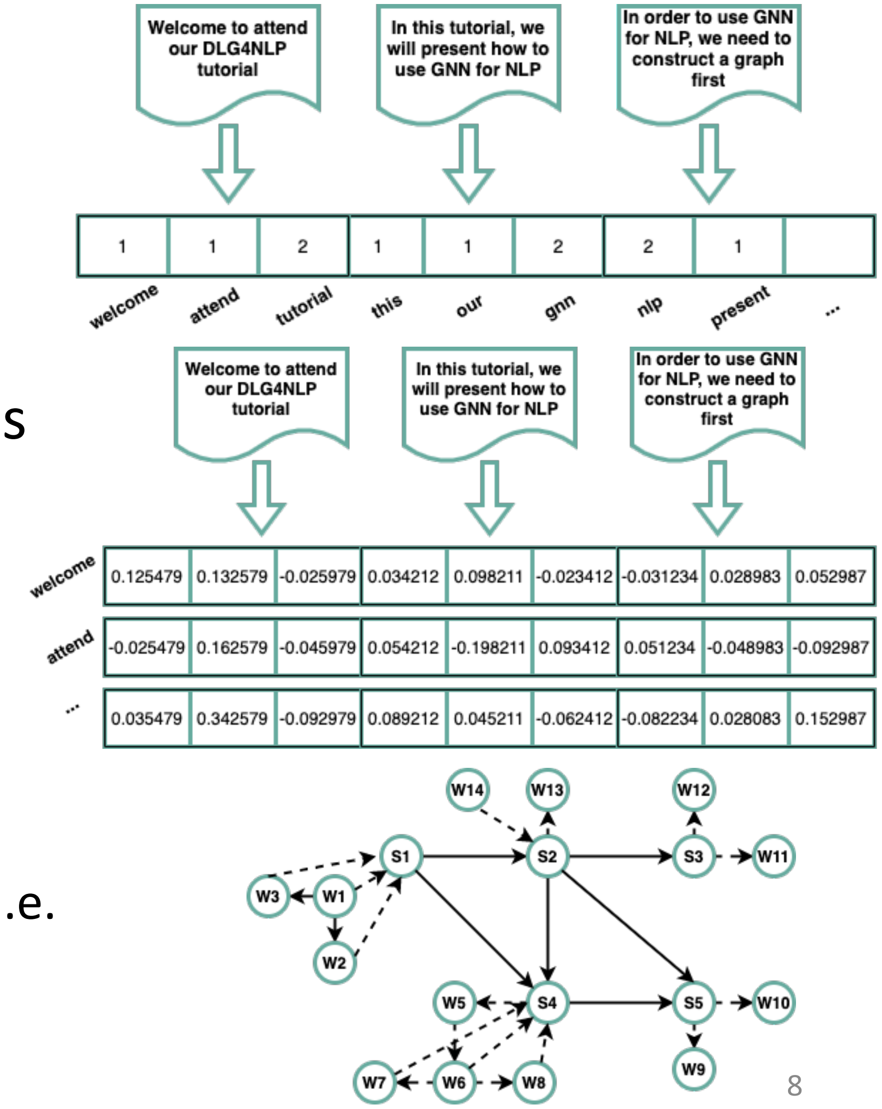


SQL graph

Machine Learning on Graphs for NLP

Natural Language Processing: A Graph Perspective

- Represent natural language as a bag of tokens
  - BOW, TF-IDF
  - Topic Modeling: text as a mixture of topics
- Represent natural language as a sequence of tokens
  - Linear-chain CRF
  - Word2vec, Glove
- Represent natural language as a graph
  - Dependency graphs, constituency graphs, AMR graphs, IE graphs, and knowledge graphs
  - Text graph containing multiple hierarchies of elements, i.e. document, sentence and word



Welcome to attend our DLG4NLP tutorial

In this tutorial, we will present how to use GNN for NLP

In order to use GNN for NLP, we need to construct a graph first

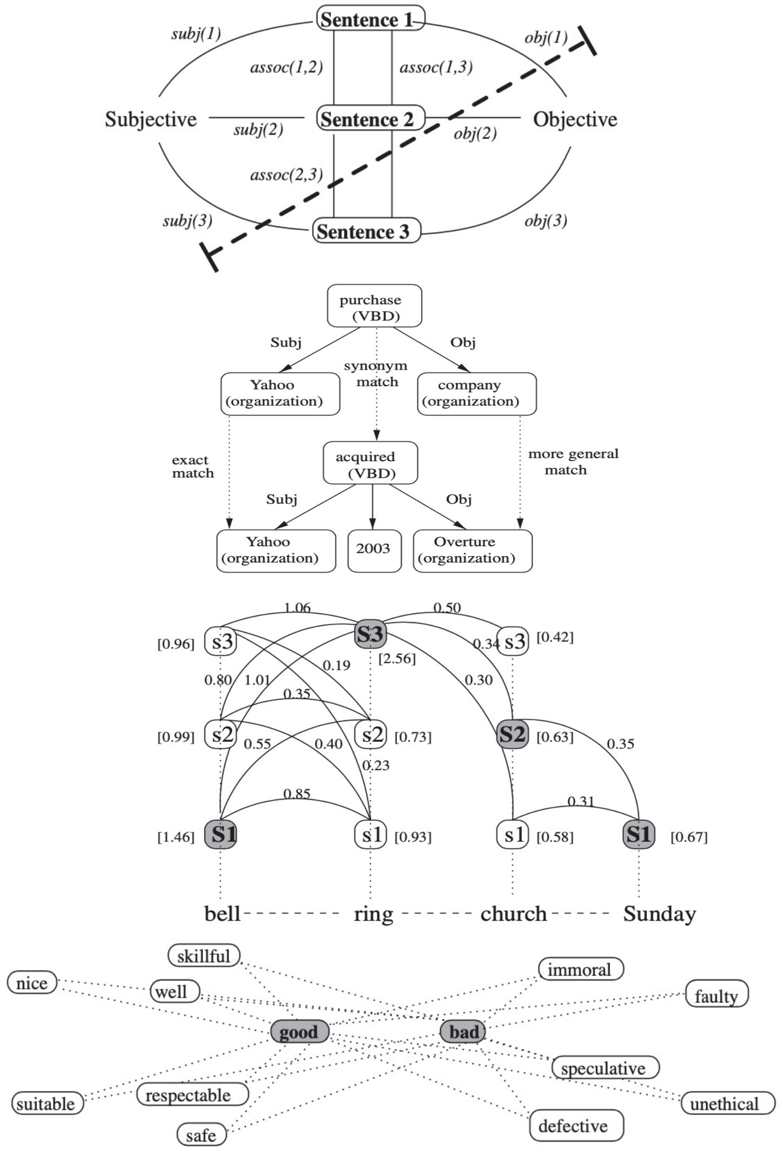
Graph Based Methods for NLP

- Random Walk Algorithms
  - Generate random paths, one can obtain a stationary distribution over all the nodes in a graph
  - Applications: semantic similarity of texts, name disambiguation
- Graph Clustering Algorithms
  - Spectral clustering, random walk clustering and min-cut clustering for text clustering
- Graph Matching Algorithms
  - Compute the similarity between two graphs for textual entailment task
- Label Propagation Algorithms
  - Propagate labels from labeled data points to previously unlabeled data points
  - Applications: word-sense disambiguation, sentiment analysis

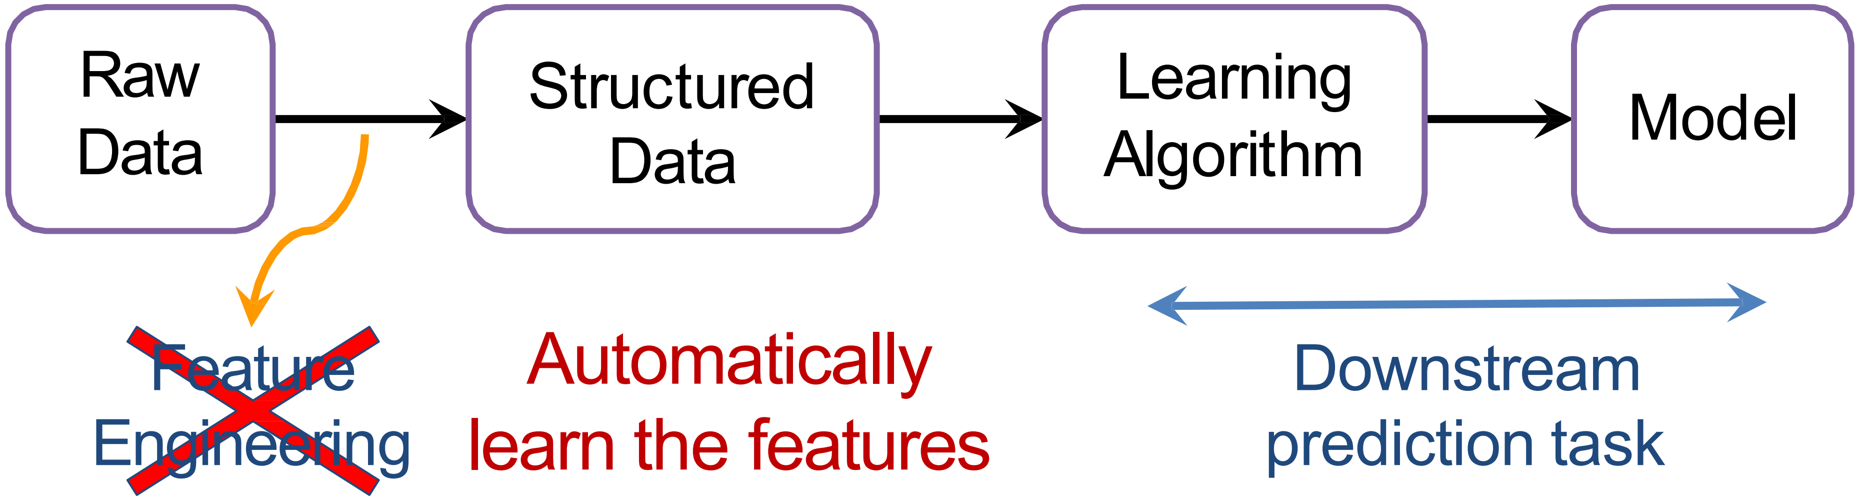
[Mihalcea and Radev, 2011]



Deep Learning on Graphs: Foundations and Models

Machine Learning Lifecycle

- (Supervised) Machine Learning Lifecycle: feature learning is the key



Raw Data

Structured Data

Learning Algorithm

Model

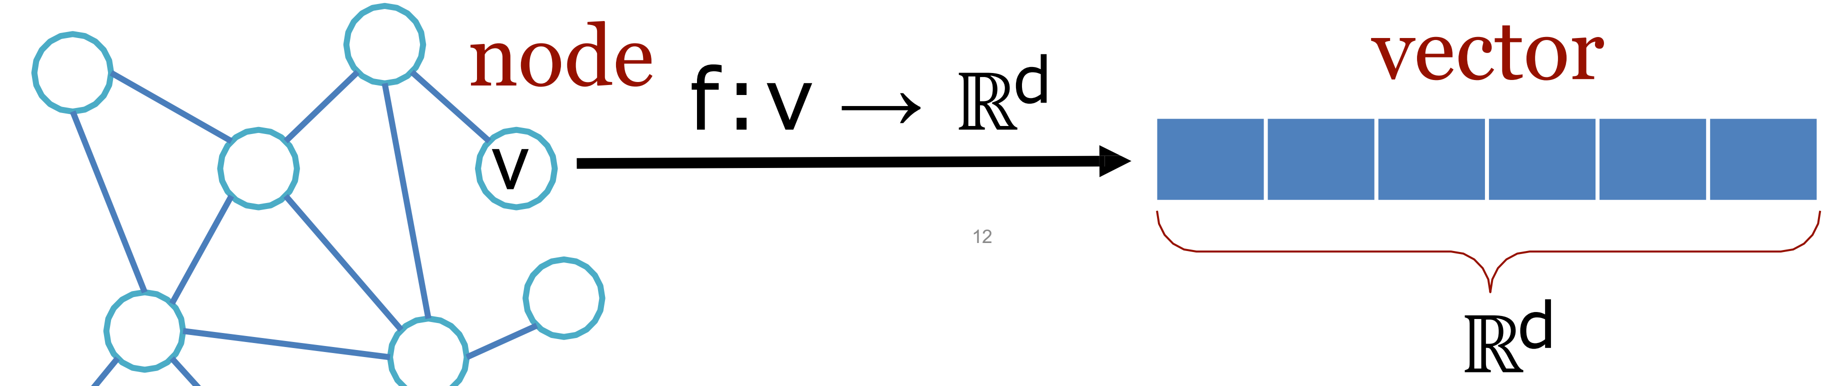
~~Feature Engineering~~

Automatically learn the features

Downstream prediction task

Feature Learning in Graphs

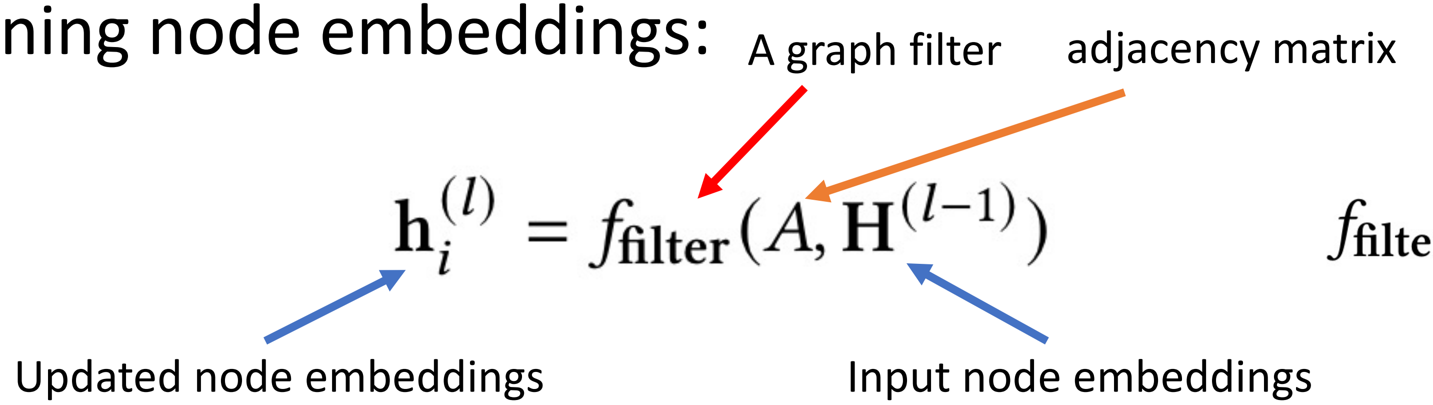
- Our Goal: Design efficient task-independent/ task-dependent feature learning for machine learning in graphs!



Feature representation, embedding

Graph Neural Networks: Foundations

- Learning node embeddings:



$$\mathbf{h}_i^{(l)} = f_{\text{filter}}(A, \mathbf{H}^{(l-1)})$$

A graph filter

adjacency matrix

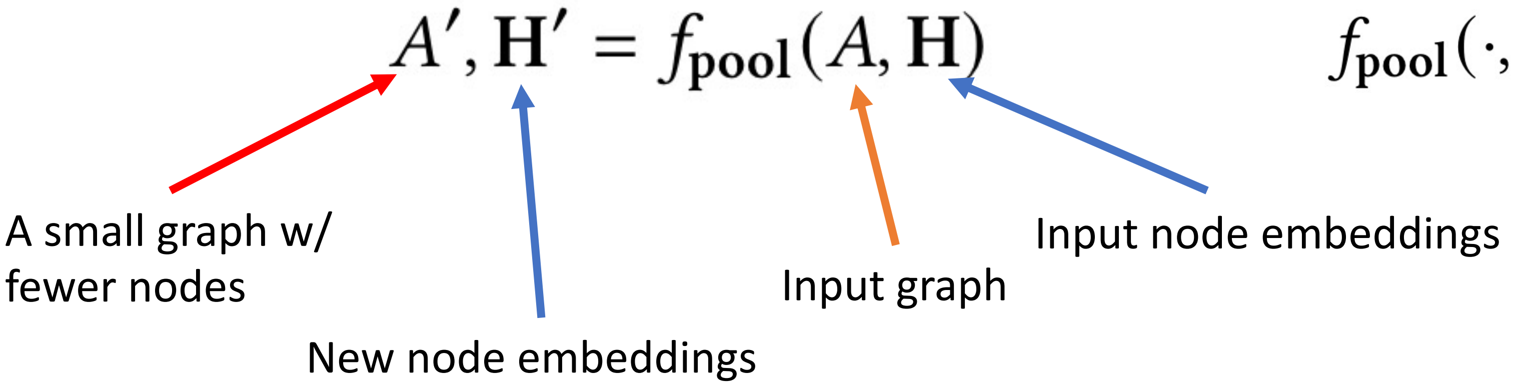
Updated node embeddings

Input node embeddings

$f_{\text{filter}}(\cdot,\cdot)$

- Spectral-based
- Spatial-based
- Attention-based
- Recurrent-based

- Learning graph-level embeddings:



$$A', \mathbf{H}' = f_{\text{pool}}(A, \mathbf{H})$$

A small graph w/ fewer nodes

New node embeddings

Input graph

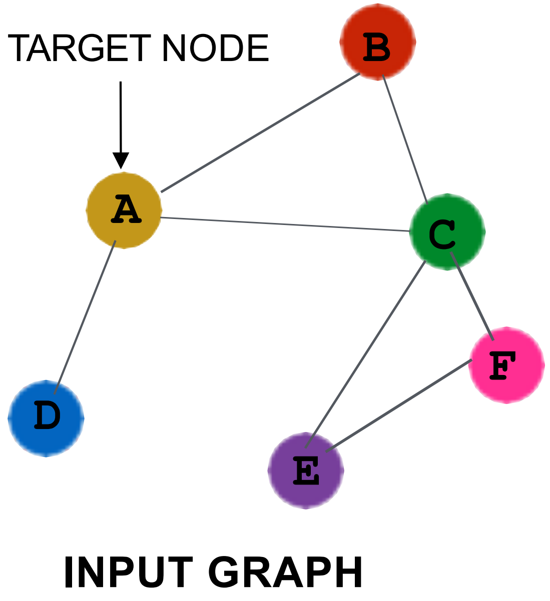
Input node embeddings

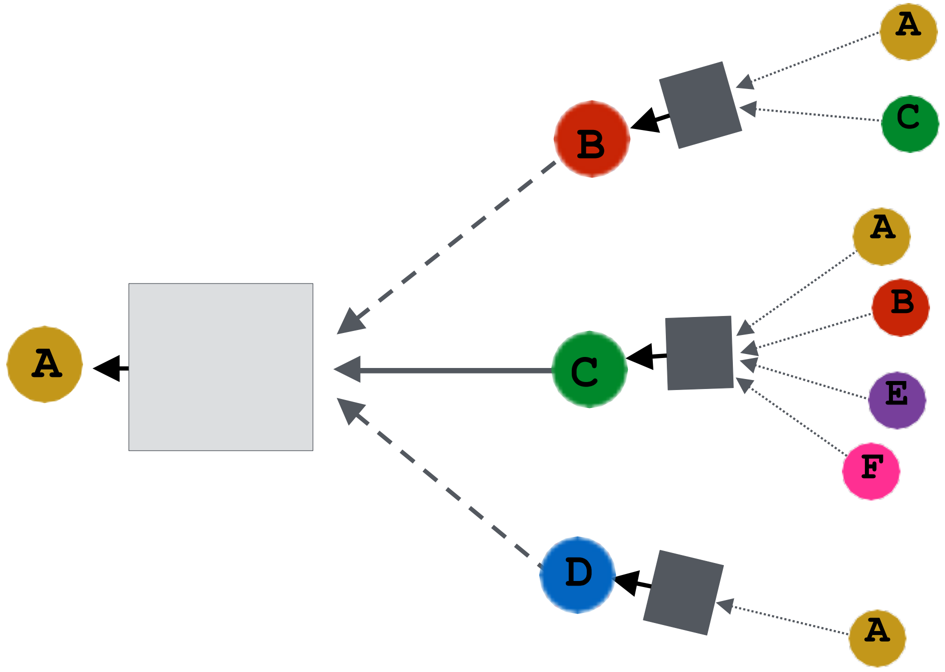
$f_{\text{pool}}(\cdot,\cdot)$

- Flat Graph Pooling (i.e. Max, Ave, Min)
- Hierarchical Graph Pooling (i.e. Diffpool)

Graph Neural Networks: Basic Model

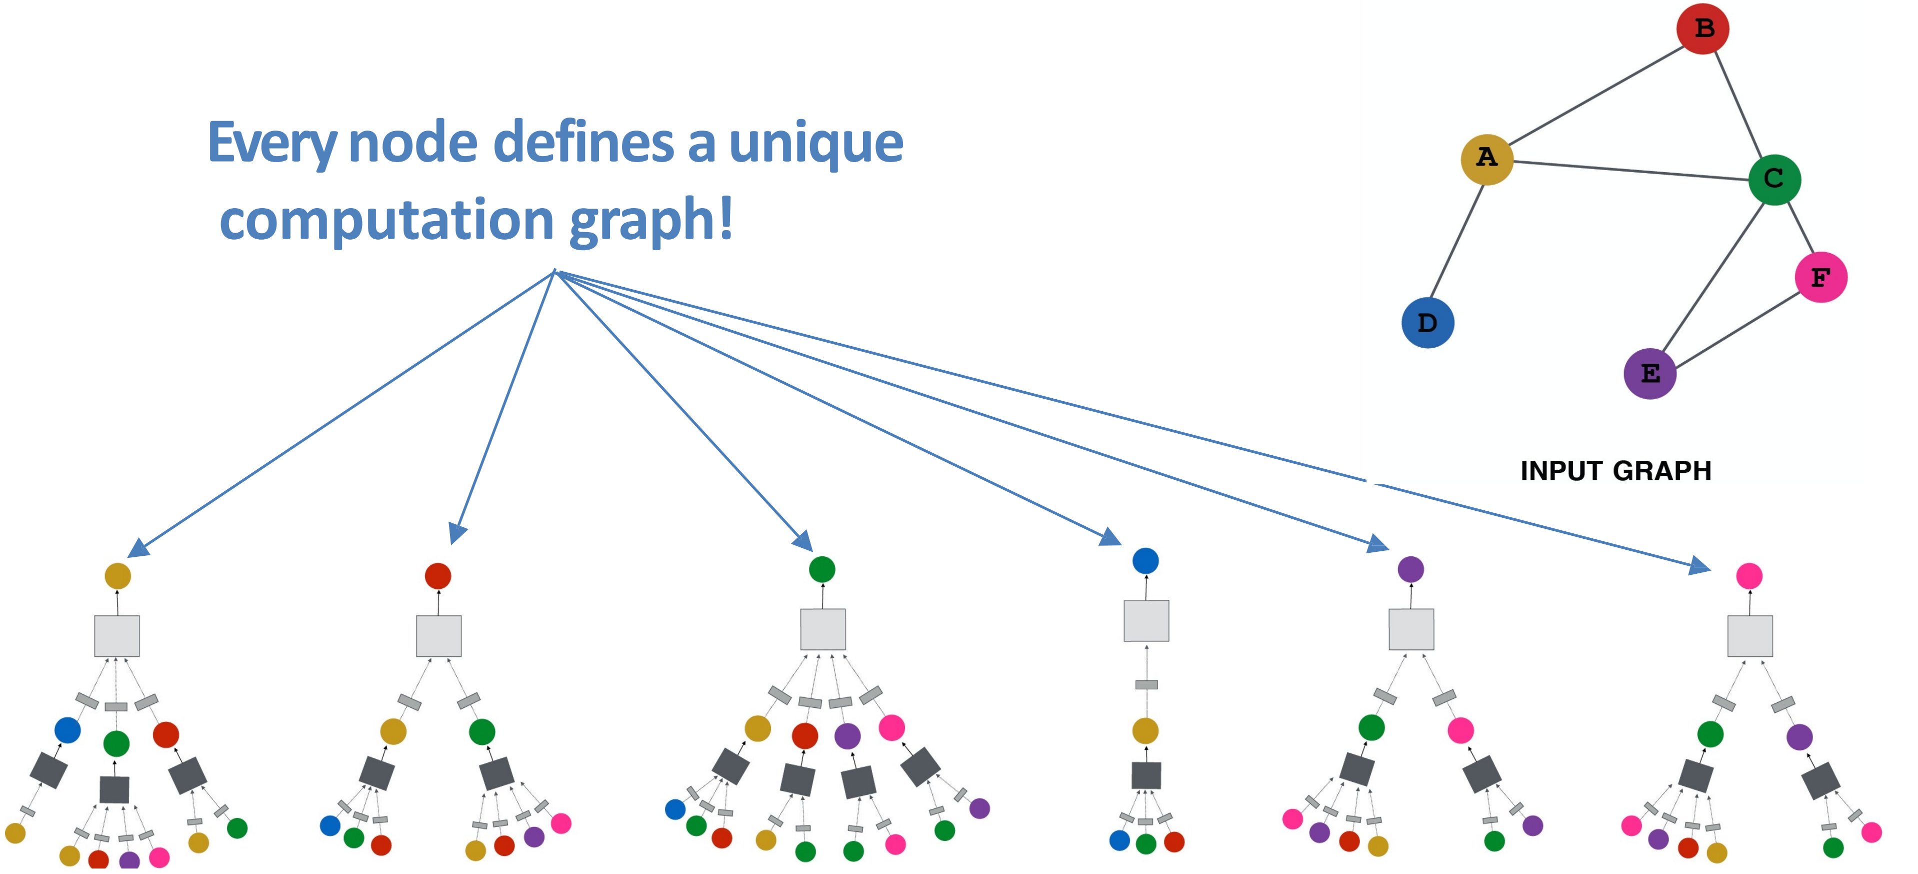
- Key idea: Generate node embeddings based on local neighborhoods.





Neighborhood Aggregation

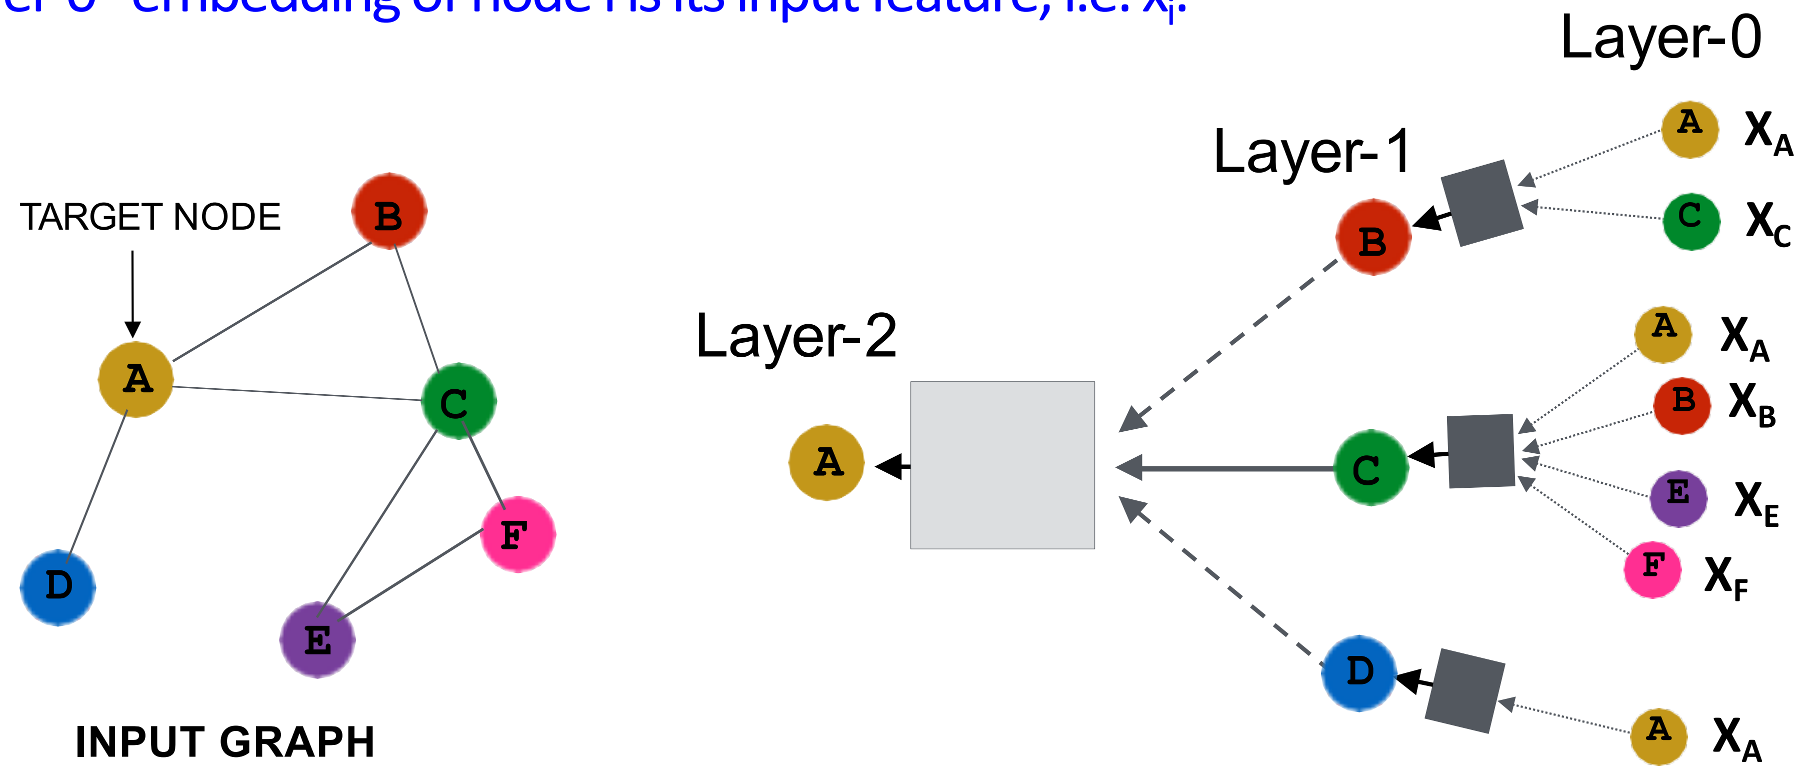
- Intuition: Network neighborhood defines a computation graph



Every node defines a unique computation graph!

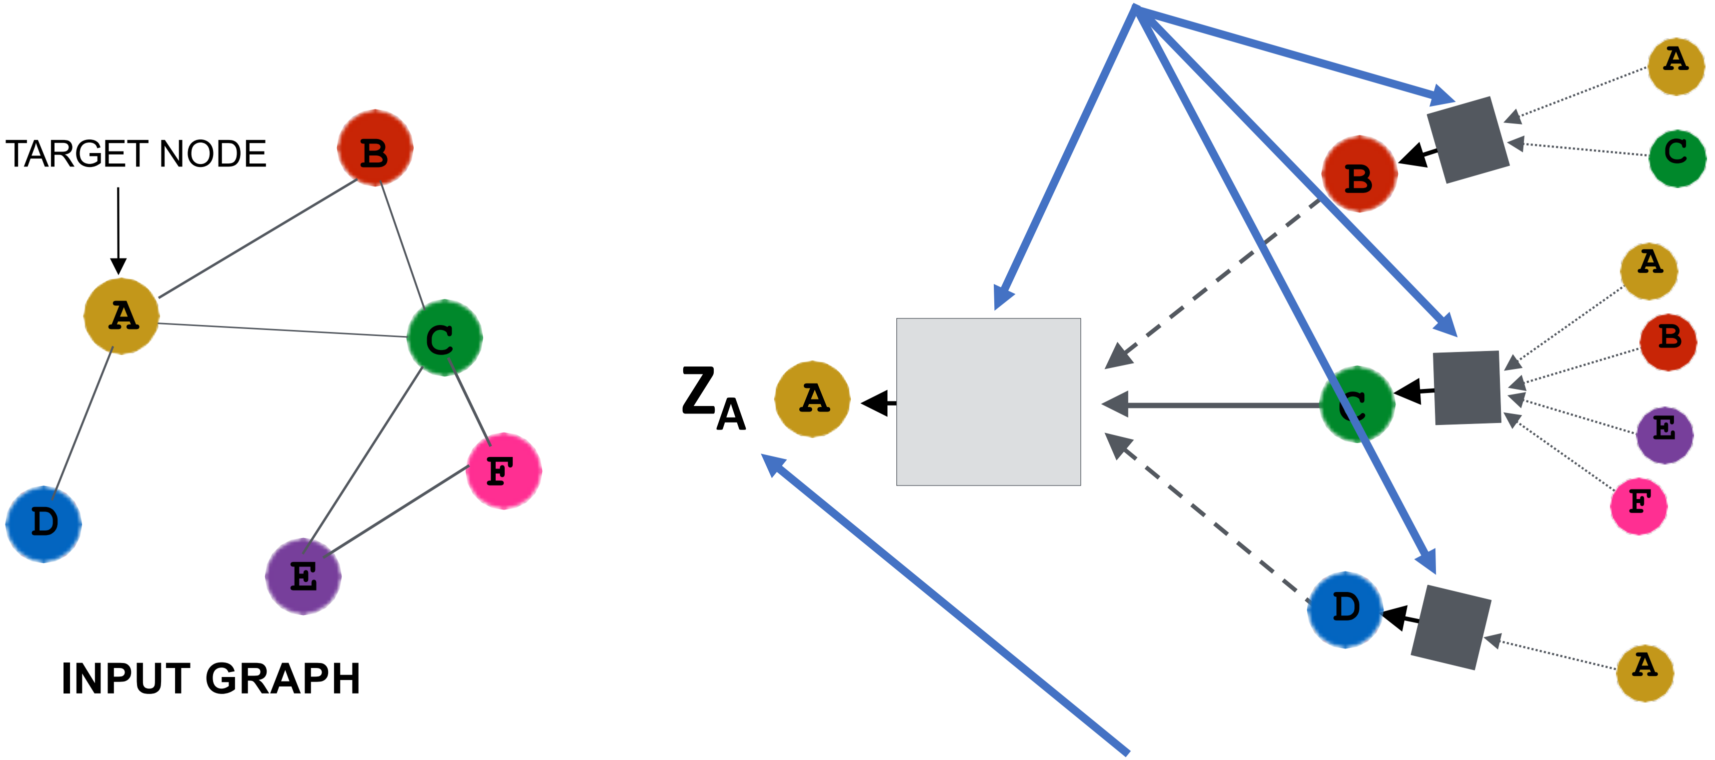
Neighborhood Aggregation

- Nodes have embeddings at each layer.
- Model can be arbitrary depth.
- "layer-0" embedding of node i is its input feature, i.e. x_i.



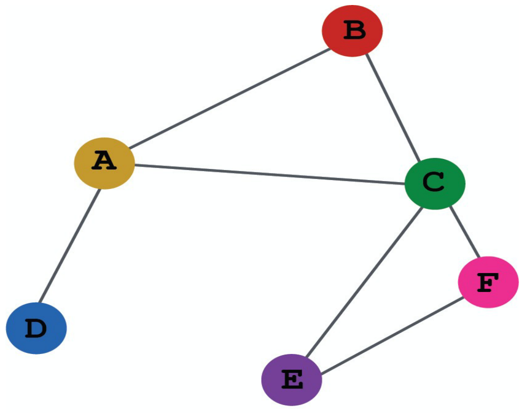
Overview of GNN Model

1) Define a neighborhood aggregation function



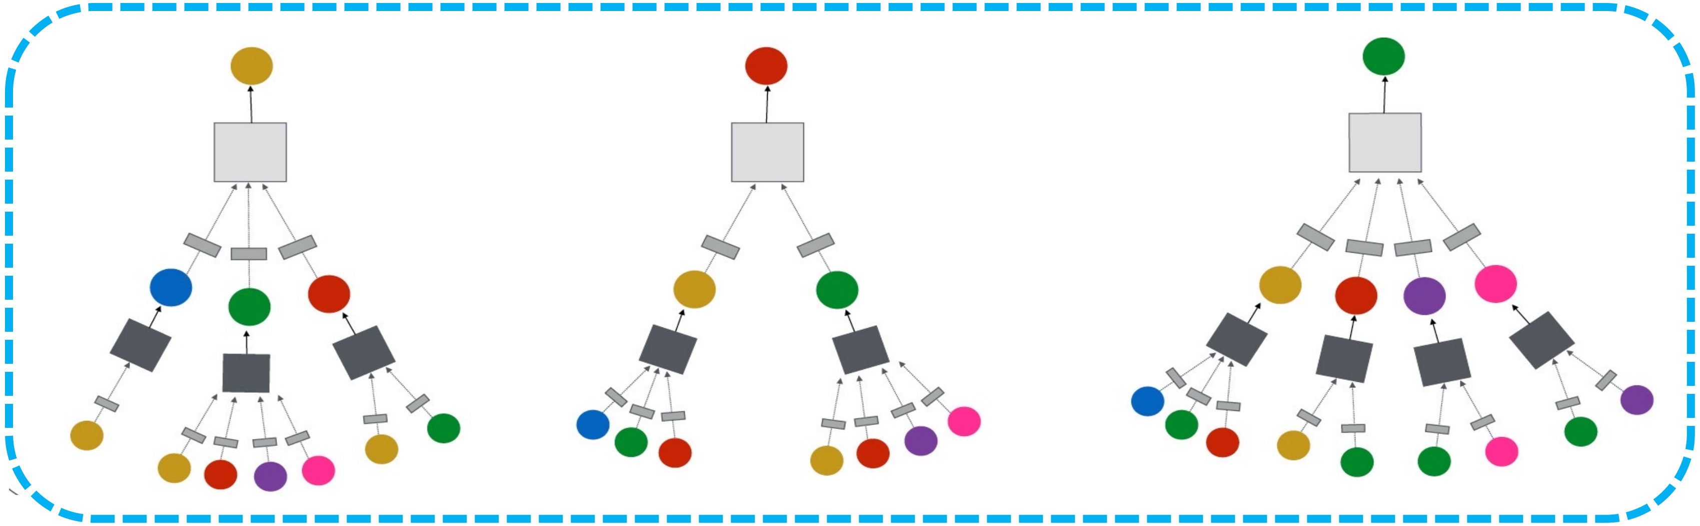
2) Define a loss function on the embeddings, **L(z_v)**

Overview of GNN Model

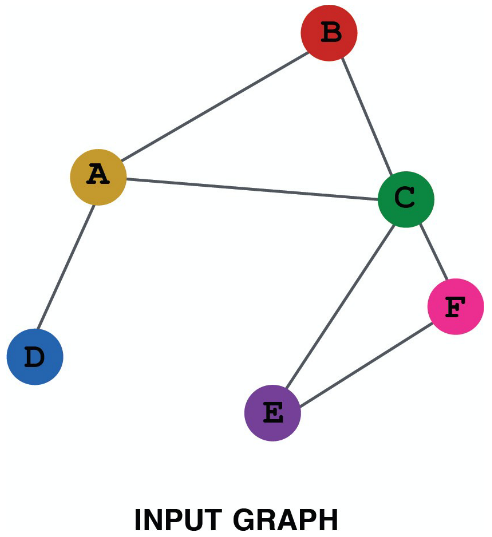


INPUT GRAPH

3) Train on a set of nodes, i.e., a batch of computation graphs

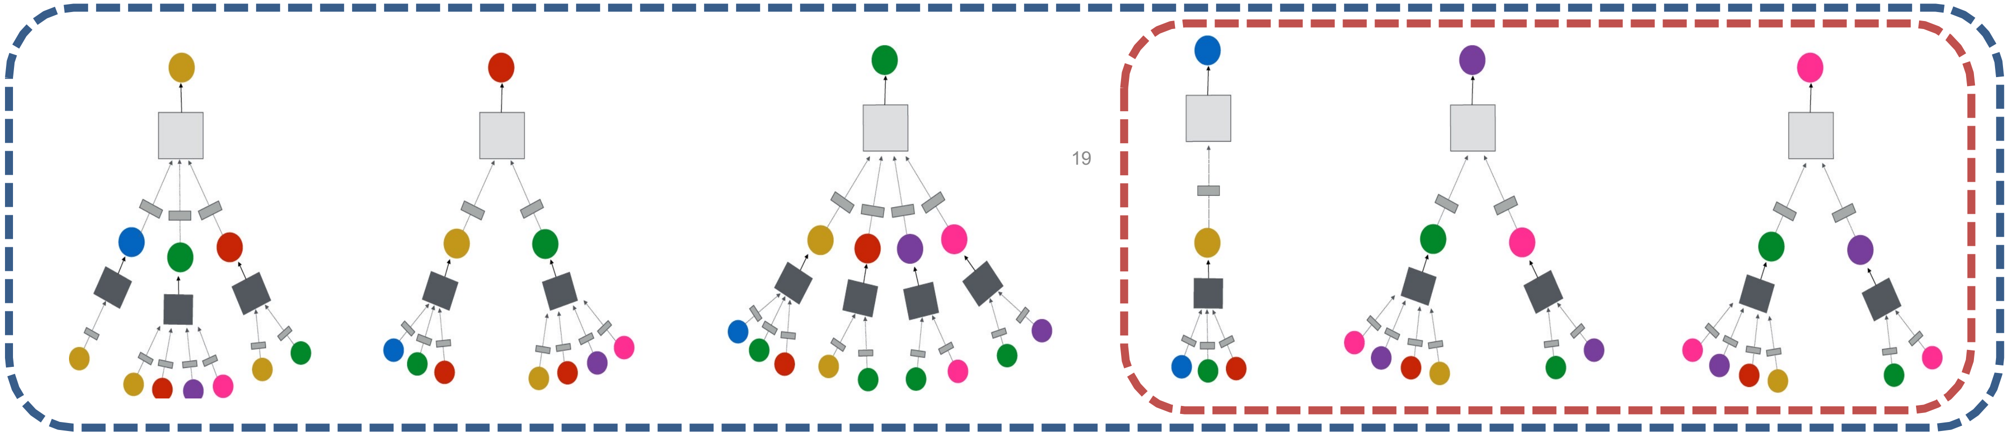


Overview of GNN Model



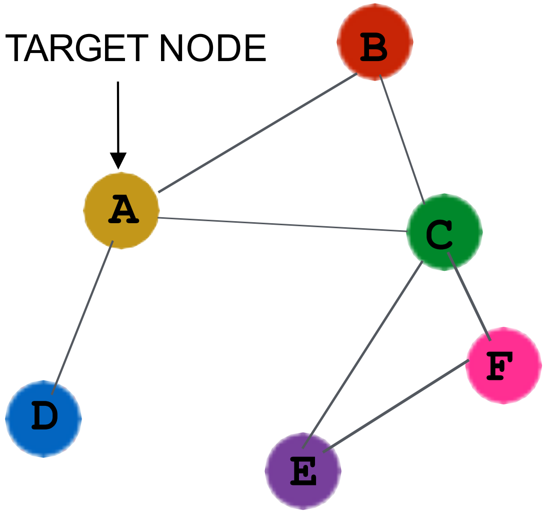
4) Generate embeddings for nodes as needed

Even for nodes we never trained on!

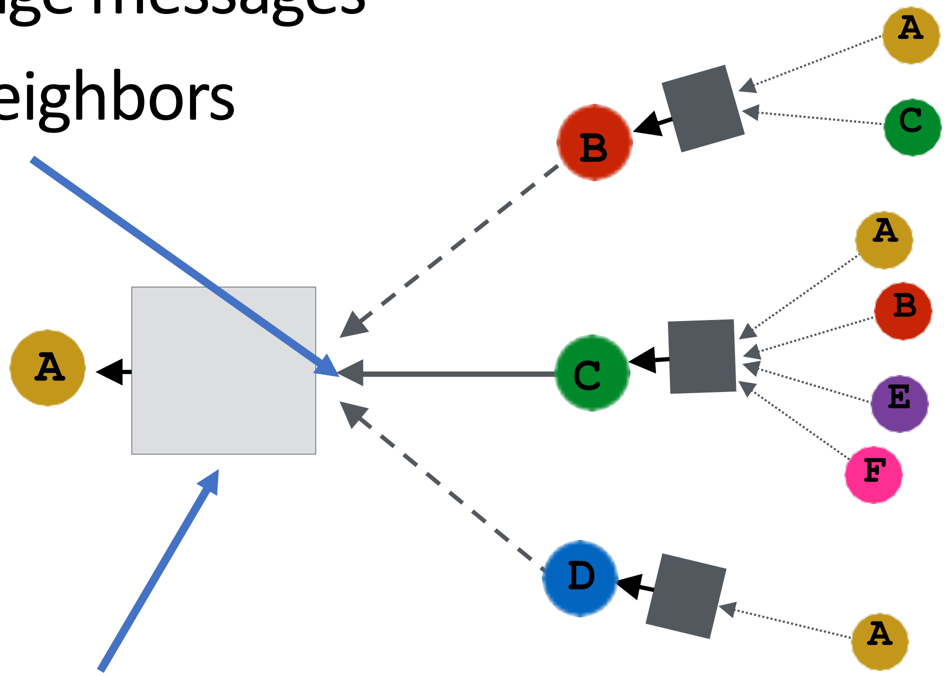


GNN Model: A Case Study

- Basic approach: Average neighbor information and apply a neural network



INPUT GRAPH

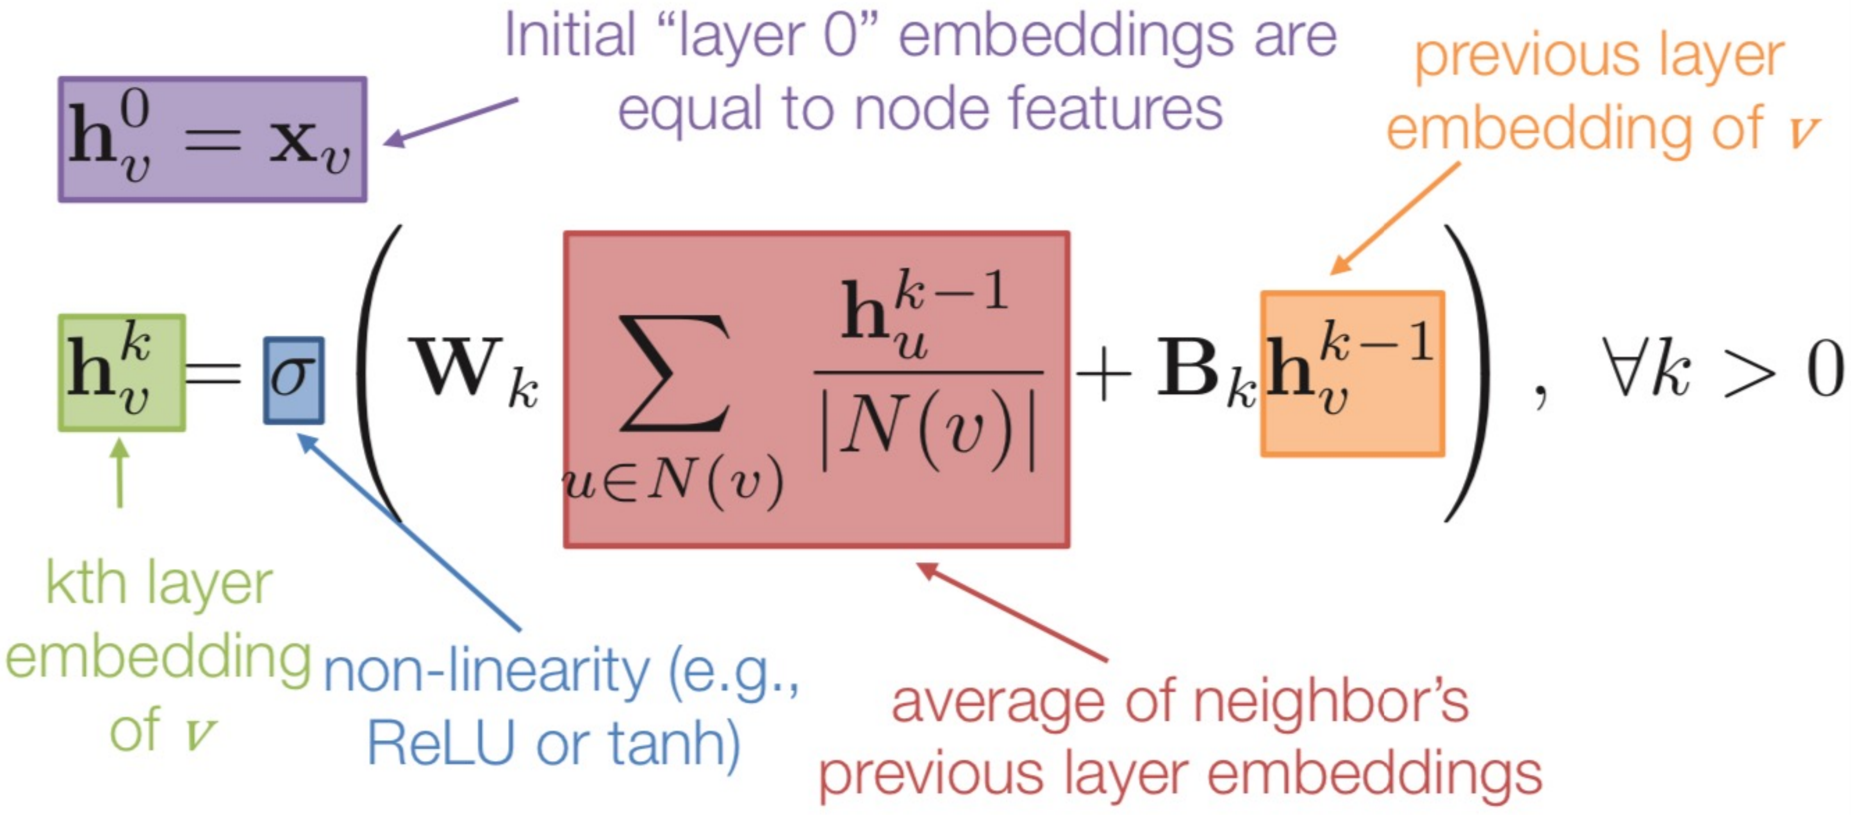


1) average messages from neighbors

2) apply neural network

GNN Model: A Case Study

- Basic approach: Average neighbor information and apply a neural network.



$$\mathbf{h}_v^0 = \mathbf{x}_v$$

$$\mathbf{h}_v^k = \sigma\left(\mathbf{W}_k \sum_{u \in N(v)} \frac{\mathbf{h}_u^{k-1}}{|N(v)|} + \mathbf{B}_k \mathbf{h}_v^{k-1}\right), \quad \forall k > 0$$

Initial “layer 0” embeddings are equal to node features
previous layer embedding of *v*
kth layer embedding of *v*
non-linearity (e.g., ReLU or tanh)
average of neighbor’s previous layer embeddings

GNN Model: Quick Summary

- Key idea: generate node embeddings by aggregating neighborhood information.
  - Allows for parameter sharing in the encoder
  - Allows for inductive learning

Graph Neural Networks: Popular Models

- Spectral-based Graph Filters
  - GCN (Kipf & Welling, ICLR 2017), Chebyshev-GNN (Defferrard et al. NIPS 2016)
- Spatial-based Graph Filters
  - MPNN (Gilmer et al. ICML 2017), GraphSage (Hamilton et al. NIPS 2017)
  - GIN (Xu et al. ICLR 2019)
- Attention-based Graph Filters
  - GAT (Velickovic et al. ICLR 2018)
- Recurrent-based Graph Filters
  - GGNN (Li et al. ICLR 2016)

Graph Convolution Networks (GCN)

Key idea: spectral convolution on graphs

Eigen-decomposition is expensive

$$f_{\text{filter}} * \mathbf{x}_i = \mathbf{U} f(\Lambda) \mathbf{U}^T \mathbf{x}_i$$

Chebyshev polynomials accelerates but still not powerful

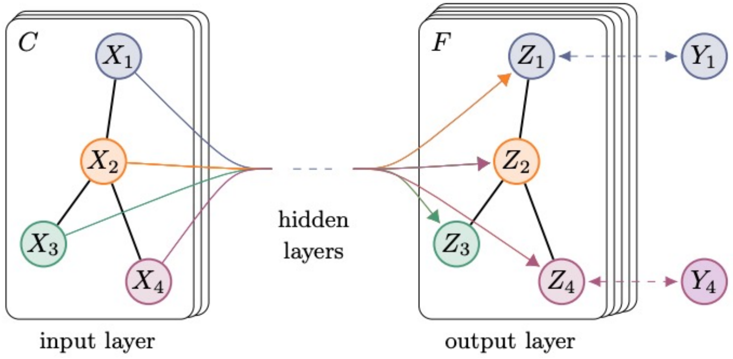
$$f'_{\text{filter}} * \mathbf{x}_i \approx \sum_{p=0}^{P} \theta'_p \mathbf{T}_p(\tilde{\mathbf{L}}) \mathbf{x}_i$$

First-order approximation fast and powerful

$$f_{\text{filter}} * \mathbf{h}_i^{(l)} \approx \theta(I_n + D^{-\frac{1}{2}} A D^{-\frac{1}{2}}) \mathbf{h}_i^{(l)}$$

Renormalization trick stabilizes the numerical computation

$$\mathbf{H}^{(l+1)} = \sigma(\tilde{D}^{-\frac{1}{2}} \tilde{A} \tilde{D}^{-\frac{1}{2}} \mathbf{H}^{(l)} \mathbf{W}^{(l)})$$



GCN in NLP Tasks:

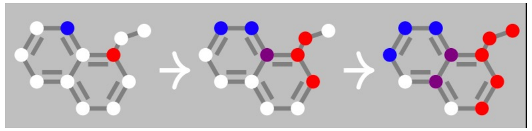
- Text classification
- Question Answering
- Text Matching
- Topic Modeling
- Information Extration

Message Passing Neural Network (MPNN)

Key idea: graph convolutions as a message passing process

MPNN:

$$\mathbf{h}_i^{(l)} = f_{\text{filter}}(A, \mathbf{H}^{(l-1)}) = f_U(\mathbf{h}_i^{(l-1)}, \sum_{v_j \in N(v_i)} f_M(\mathbf{h}_i^{(l-1)}, \mathbf{h}_j^{(l-1)}, \mathbf{e}_{i,j}))$$



Node and edge embeddings

Update and aggregation functions

expensive if the number of nodes are large

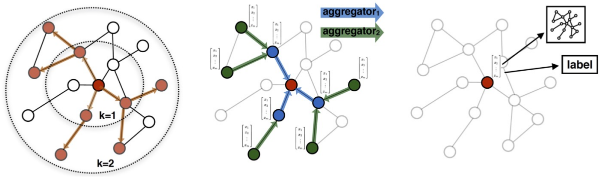
GraphSage:

$$f_{\text{filter}}(A, \mathbf{H}^{(l-1)}) = \sigma(\mathbf{W}^{(l)} \cdot f_M(\mathbf{h}_i^{(l-1)}, \{\mathbf{h}_j^{(l-1)}, \forall v_j \in N(v_i)\}))$$

Aggregation functions

Node embeddings

sampling to obtain a fixed number of neighbors

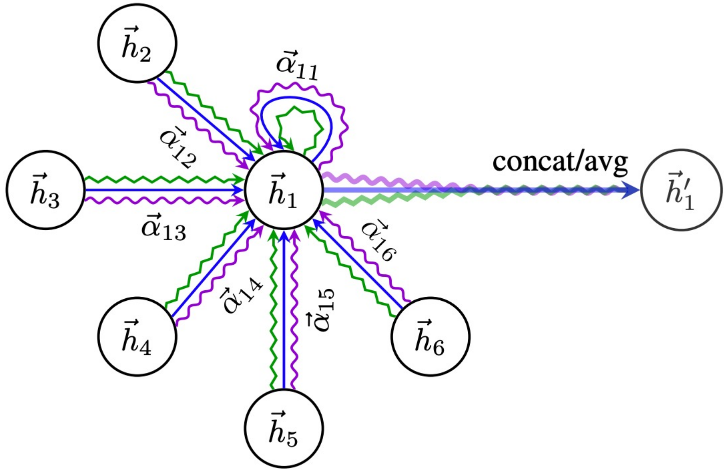


MPNN and GraphSage in NLP Tasks:

- Knowledge graph
- Information extraction
- Semantic parsing

Graph Attention Network (GAT)

Key idea: dynamically learn the weights (attention scores) on the edges when performing message passing



Weighted sum of node embeddings

$$\mathbf{h}_i^{(l)} = f_{\text{filter}}(A, \mathbf{H}^{(l-1)}) = \sigma\Big(\sum_{v_j \in N(v_i)} \alpha_{ij} \mathbf{W}^{(l)} \mathbf{h}_j^{(l-1)}\Big)$$

Learned local weights with self-attention

$$\alpha_{ij} = \frac{\exp(\text{LeakyReLU}({\mathbf{u}^{(l)}}^T [\mathbf{W}^{(l)} \mathbf{h}_i^{(l-1)} || \mathbf{W}^{(l)} \mathbf{h}_j^{(l-1)}]))}{\sum_{v_k \in N(v_i)} \exp(\text{LeakyReLU}({\mathbf{u}^{(l)}}^T [\mathbf{W}^{(l)} \mathbf{h}_i^{(l-1)} || \mathbf{W}^{(l)} \mathbf{h}_k^{(l-1)}]))}$$

Intermediate node embeddings

$$f_{\text{filter}}(A, \mathbf{H}^{(l-1)}) = ||_{k=1}^{K} \sigma\Big(\sum_{v_j \in N(v_i)} \alpha_{ij}^k \mathbf{W}_k^{(l)} \mathbf{h}_j^{(l-1)}\Big)$$

Final node embeddings

$$f_{\text{filter}}(A, \mathbf{H}^{(L-1)}) = \sigma\Big(\frac{1}{K} \sum_{k=1}^{K} \sum_{v_j \in N(v_i)} \alpha_{ij}^k \mathbf{W}_k^{(L)} \mathbf{h}_j^{(L-1)}\Big)$$

GAT in NLP Tasks:

- Text classification
- Question Answering
- Knowledge graph
- Information extraction
- Semantic parsing

Gated Graph Neural Networks (GGNN)

Key idea: the use of Gated Recurrent Units while taking into account edge type and directions

Zero-padding input node embeddings

$$\mathbf{h}_i^{(0)} = [\mathbf{x}_i^T, \mathbf{0}]^T$$

Incoming & outcoming edges for node v$_i$

$$\mathbf{a}_i^{(l)} = A_{i:}^T [\mathbf{h}_1^{(l-1)} \ldots \mathbf{h}_n^{(l-1)}]^T$$

$$\mathbf{h}_i^{(l)} = \mathrm{GRU}(\mathbf{a}_i^{(l)}, \mathbf{h}_i^{(l-1)})$$

GRU for fusing node embeddings

	Outgoing Edges				Incoming Edges			
	1	2	3	4	1	2	3	4
1		B						
2				C	B’		C’	
3		C						B’
4			B			C’		

GGNN in NLP Tasks:

- Semantic parsing
- Machine translation

DLG4NLP: A Roadmap

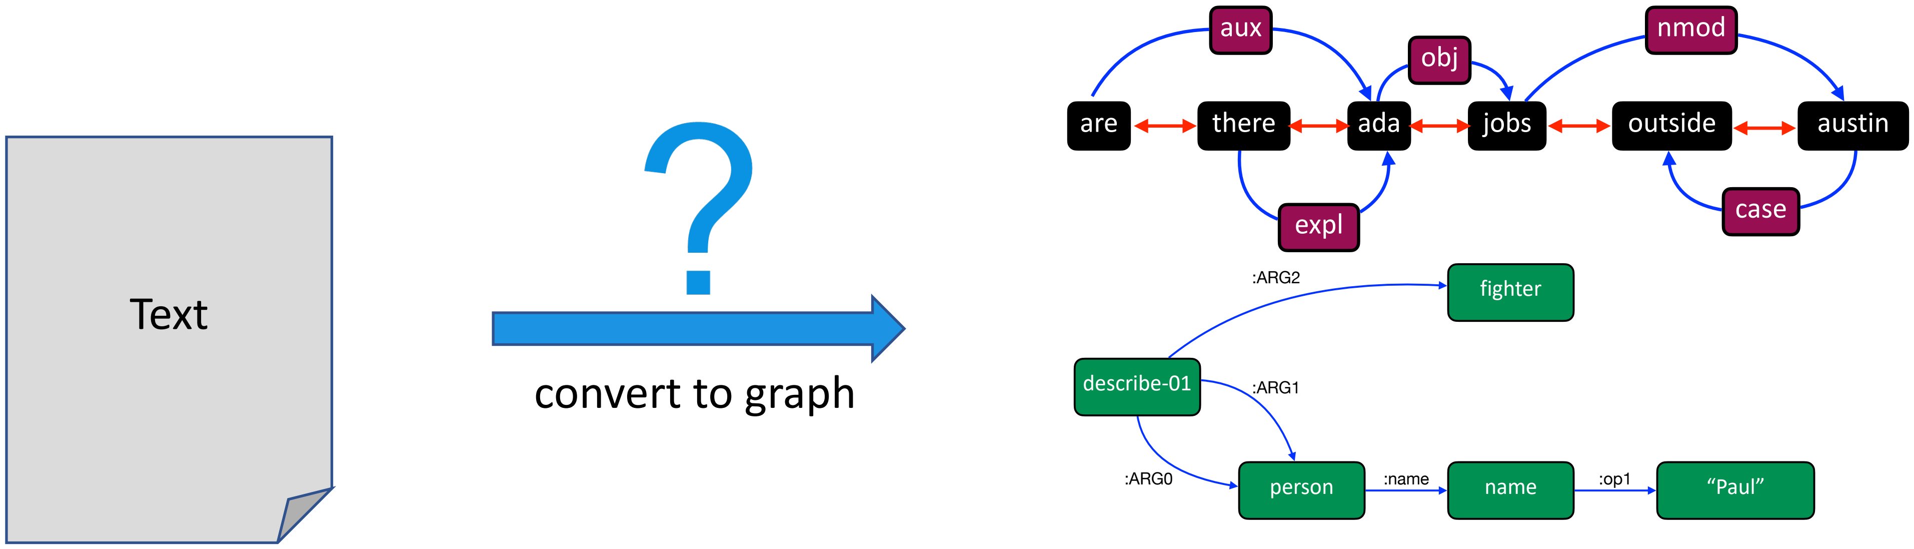
DLG4NLP Foundations

Graph Construction for NLP

Why Graph Construction for NLP?

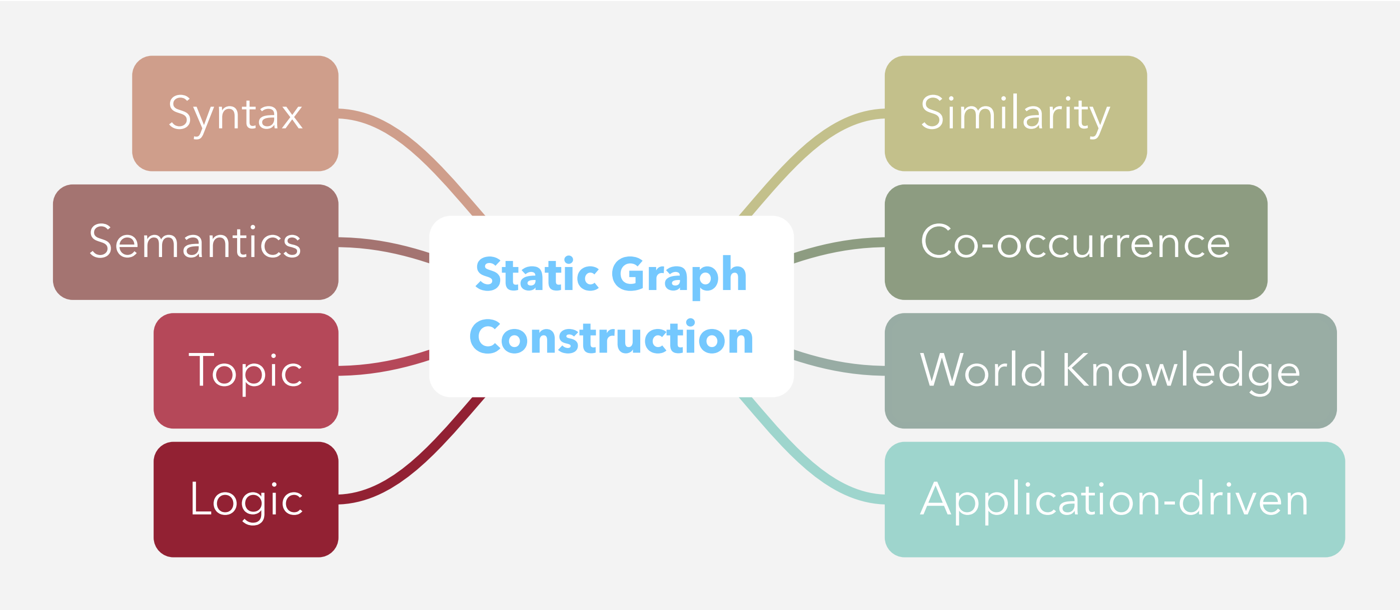
- Representation power: graph > sequence > bag
- Different NLP tasks require different aspects of text , e.g., syntax, semantics.
- Different graphs capture different aspects of the text
- Two categories: static vs dynamic graph construction
- Goal: good downstream task performance



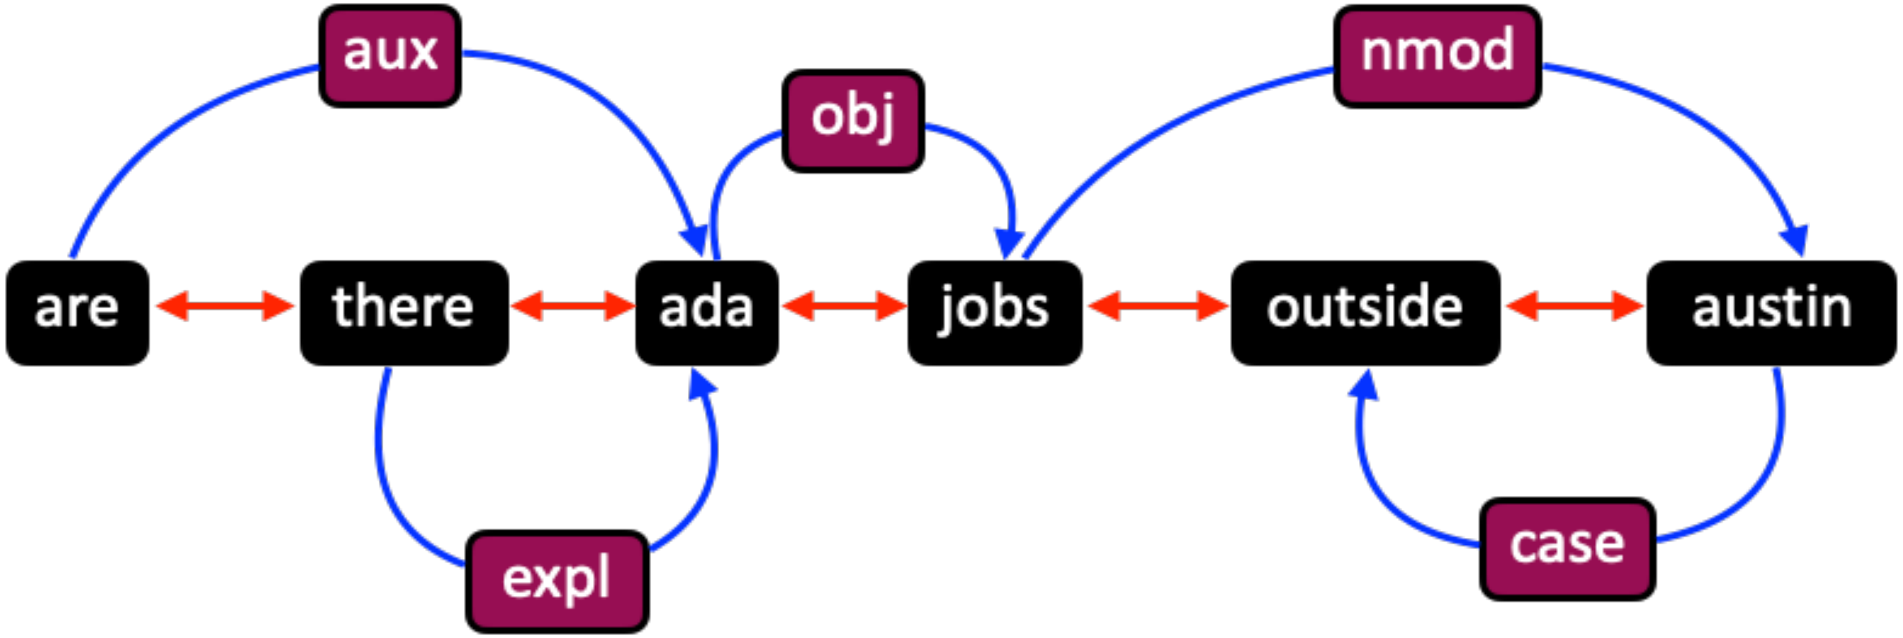
many more graph options…

Static Graph Construction

- Problem setting:
  - Input: raw text (e.g., sentence, paragraph, document, corpus)
  - Output: graph
- Conducted during preprocessing by augmenting text with domain knowledge



Static Graph Construction: Dependency Graph



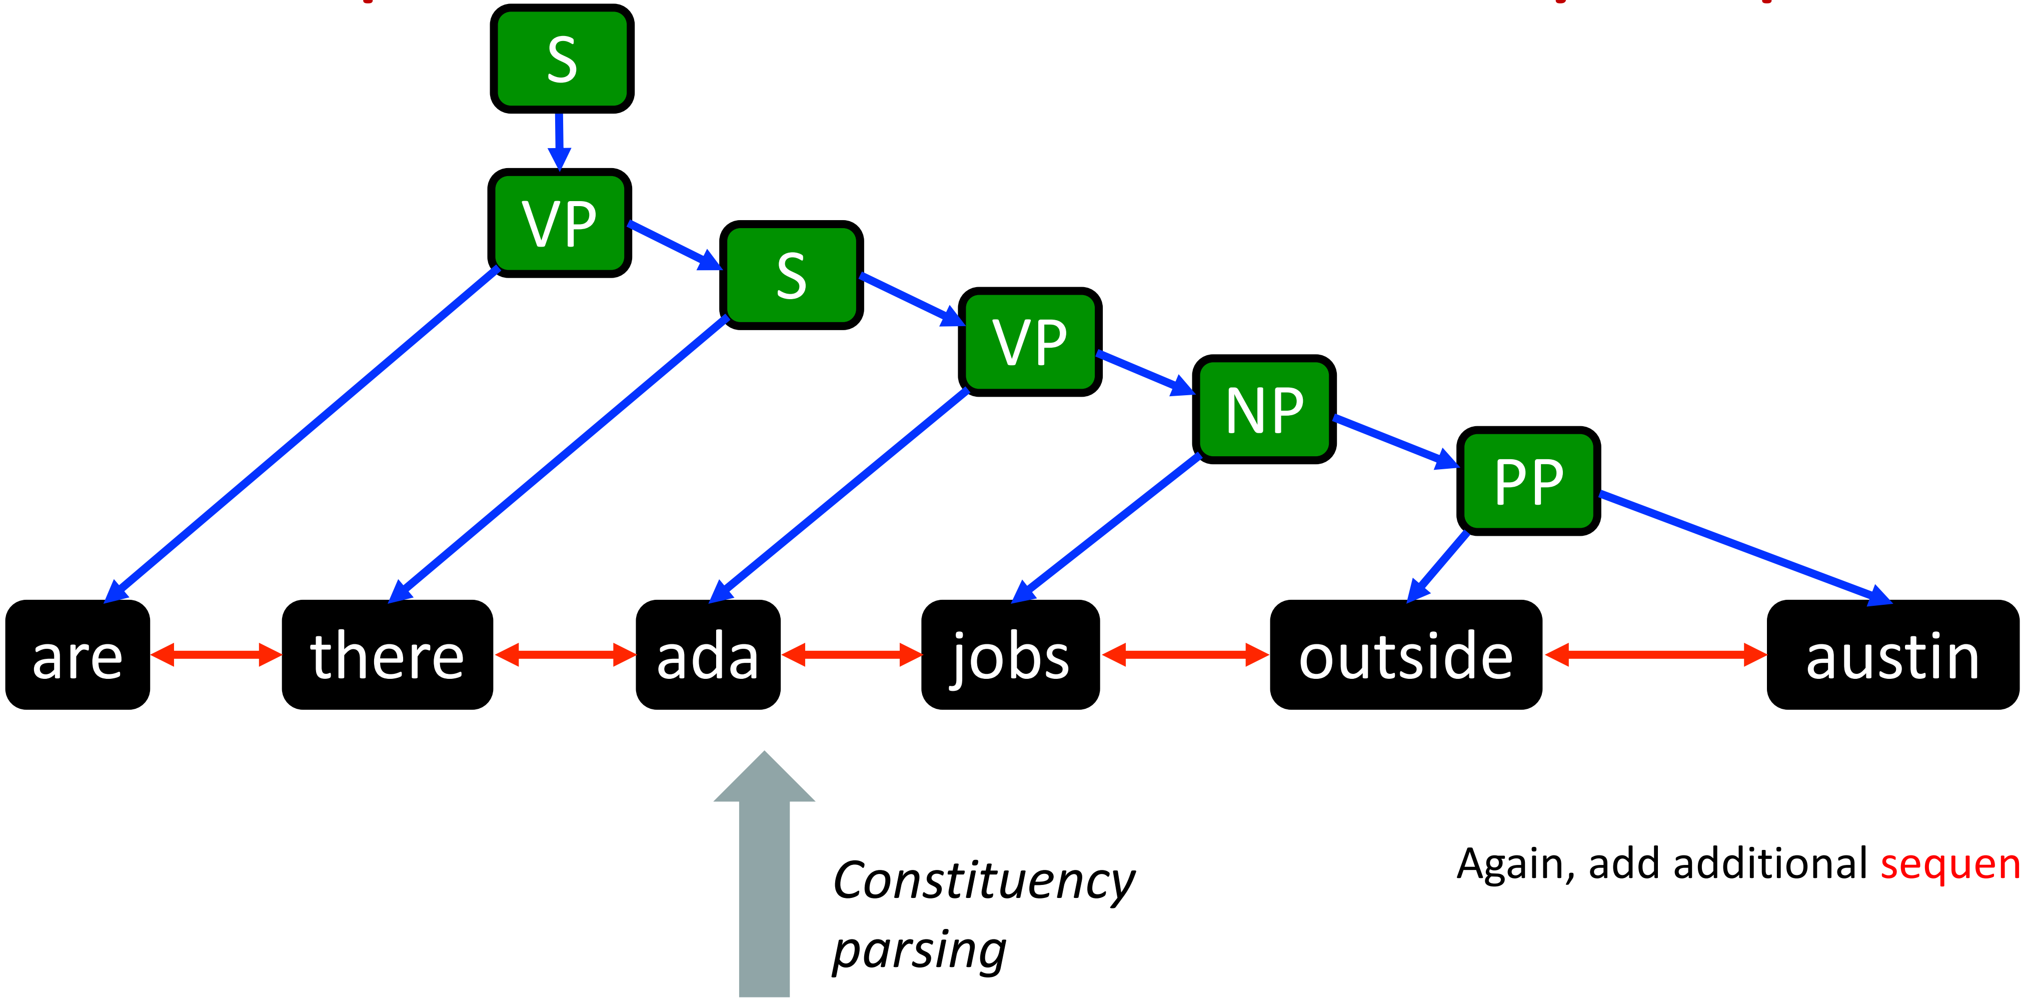
Dependency parsing

Text input: are there ada jobs outside austin

Add additional sequential edges to

1) reserve sequential information in raw text
2) connect multiple dependency graphs in a paragraph

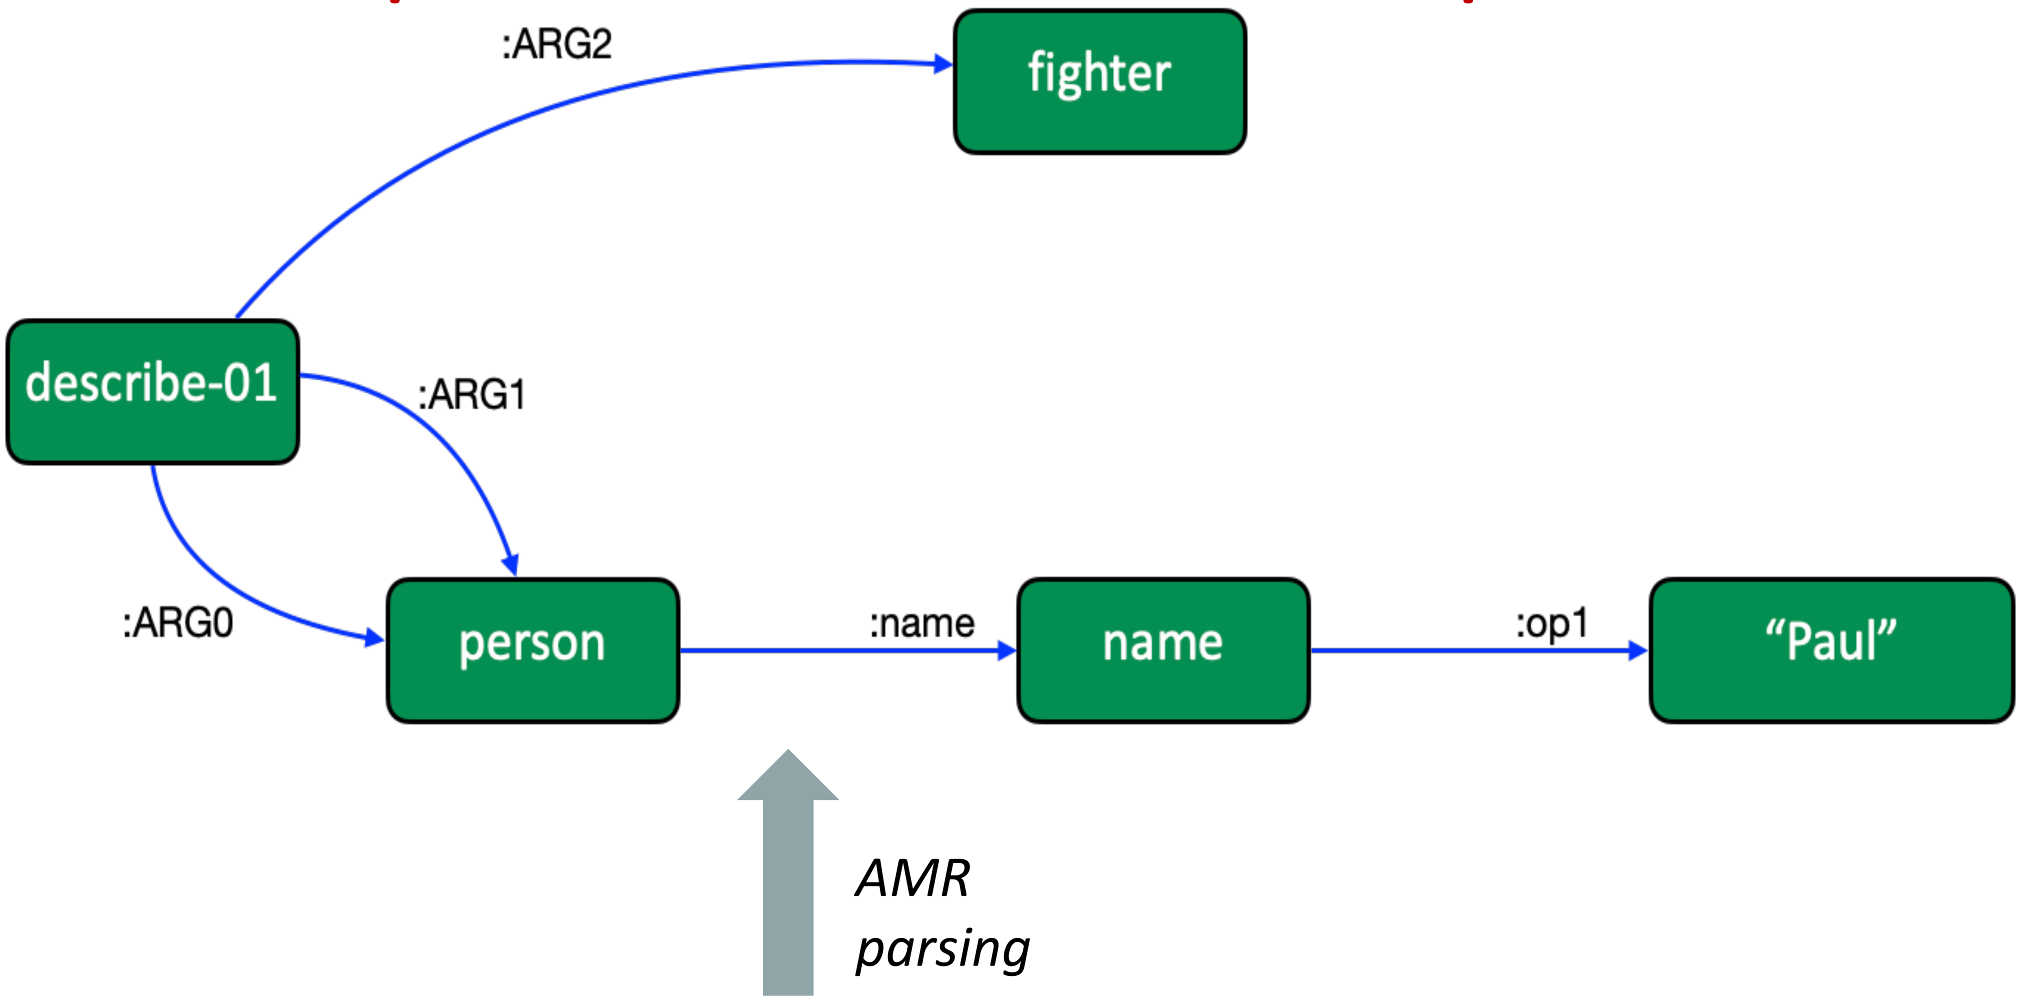
Static Graph Construction: Constituency Graph



Again, add additional sequential edges

Text input: are there ada jobs outside austin

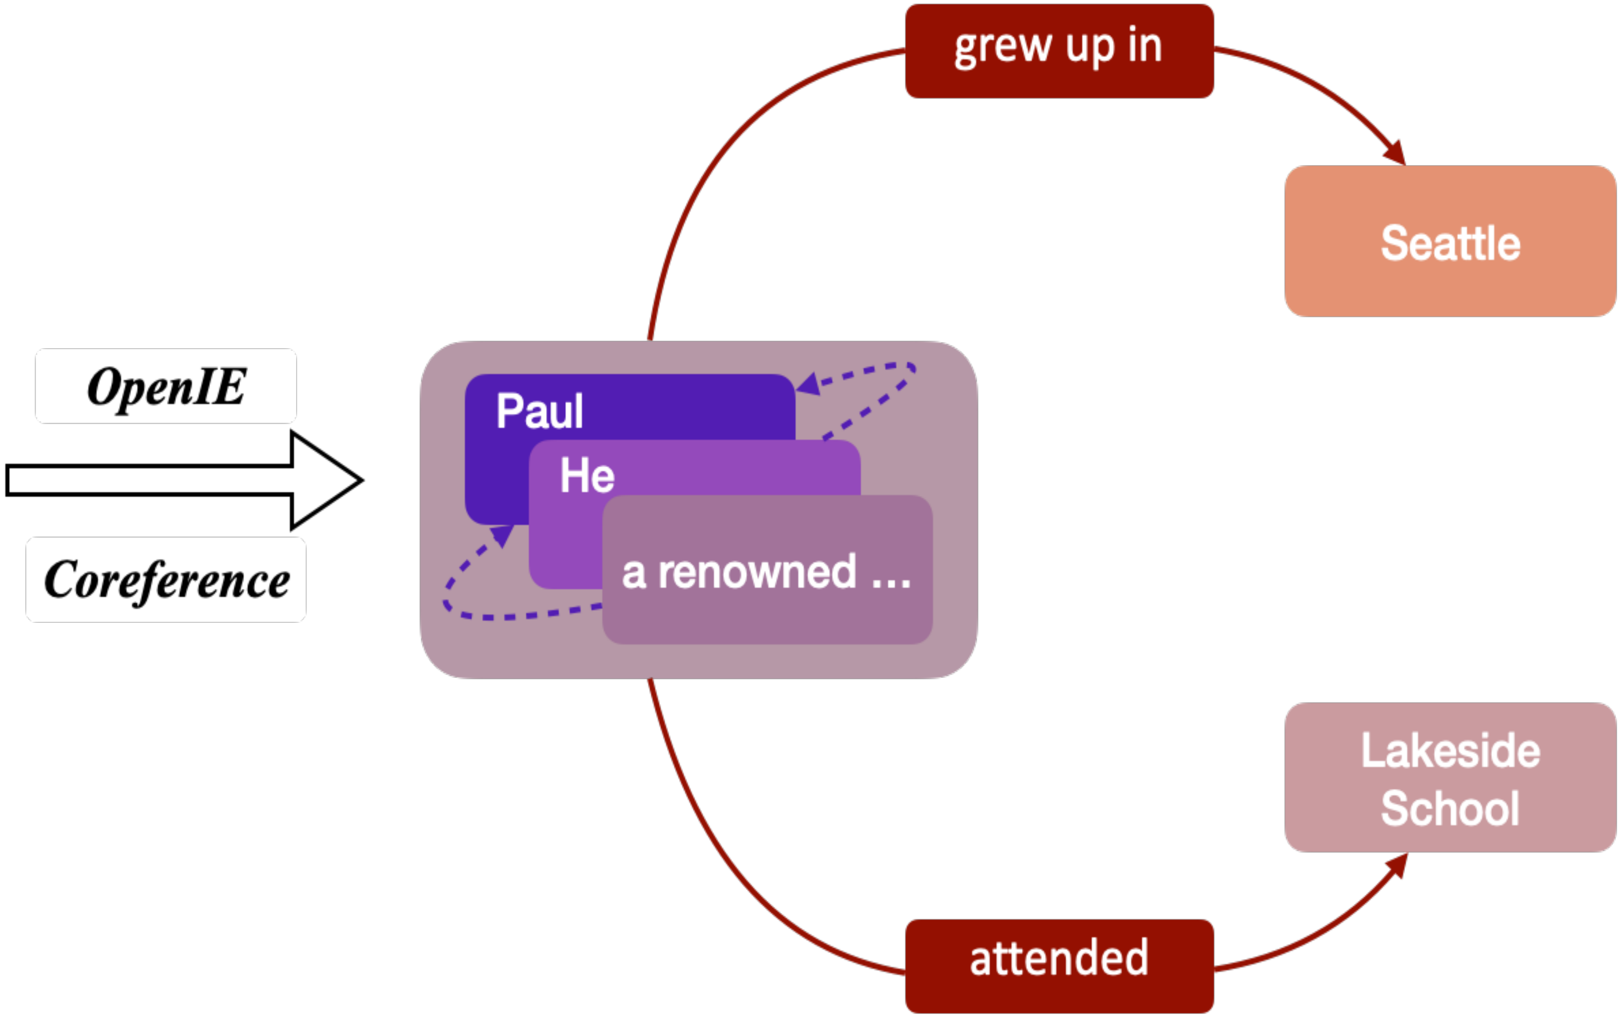
Static Graph Construction: AMR Graph



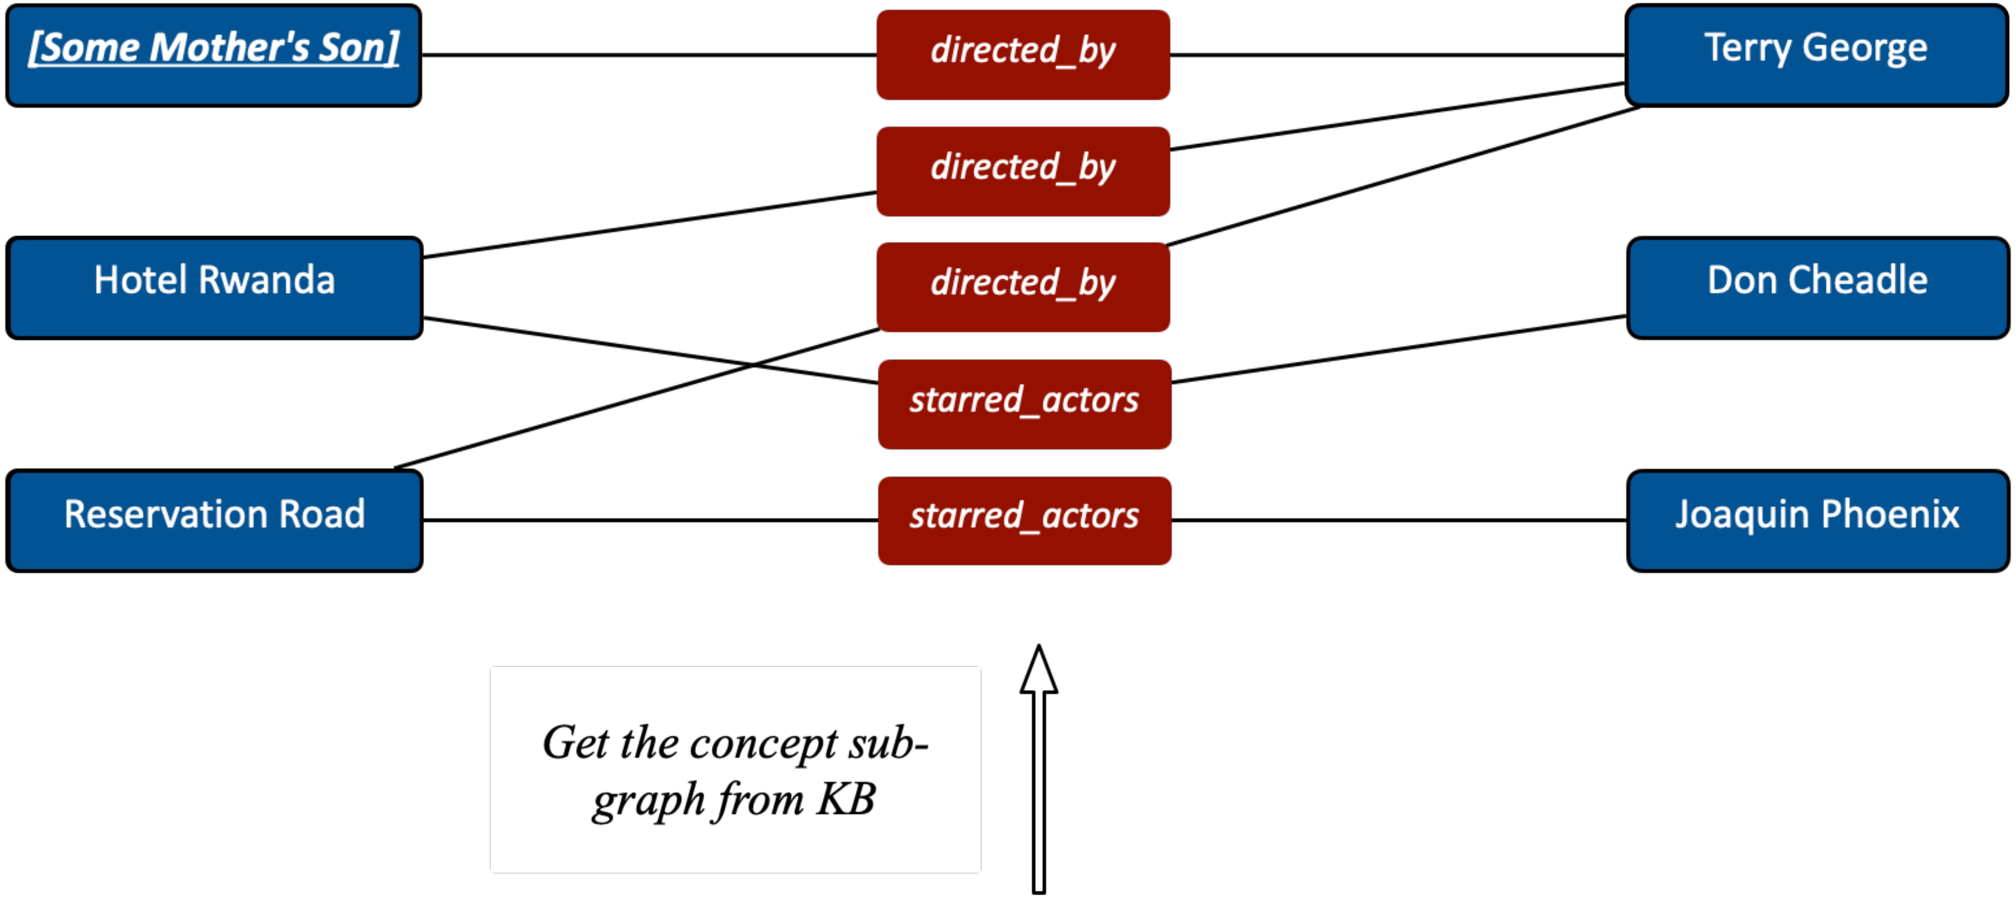
Text input: Paul's description of himself: a fighter

Static Graph Construction: IE Graph

***Text input**: Paul, a renowned computer scientist, grew up in Seattle. He attended Lakeside School.*

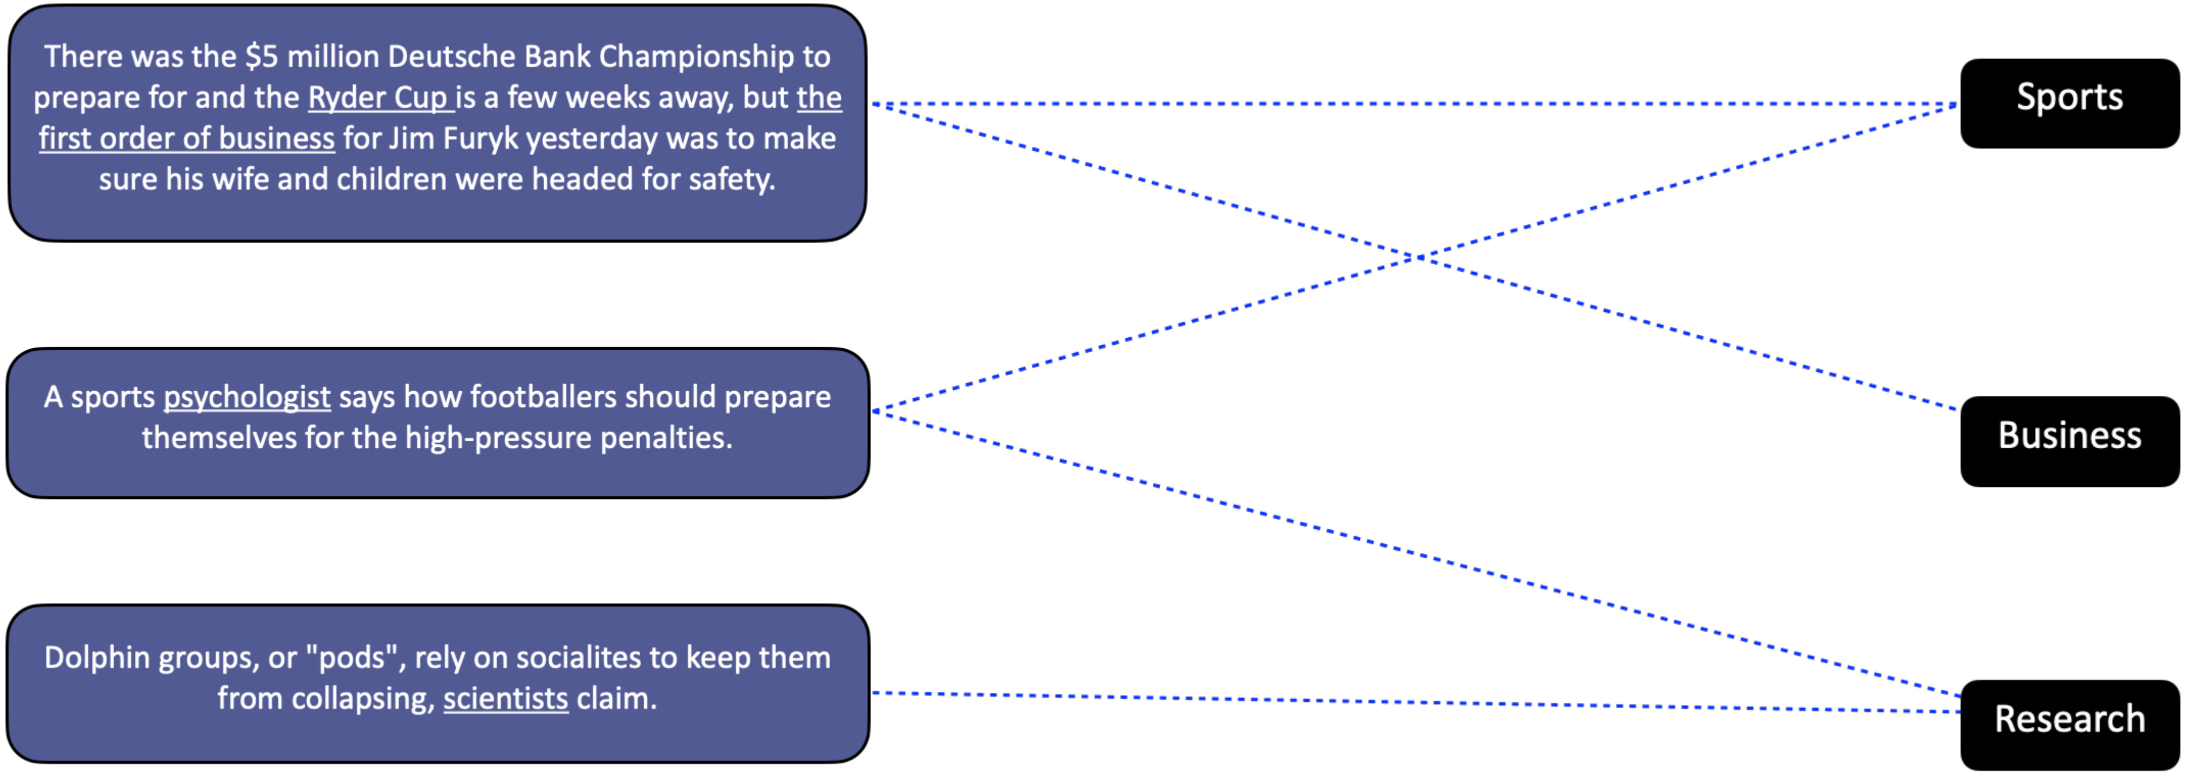


Static Graph Construction: Knowledge Graph



Question: *who acted in the movies directed by the director of* ***[Some Mother's Son]***
Answer: *Don Cheadle, Joaquin Phoenix*

Static Graph Construction: Topic Graph

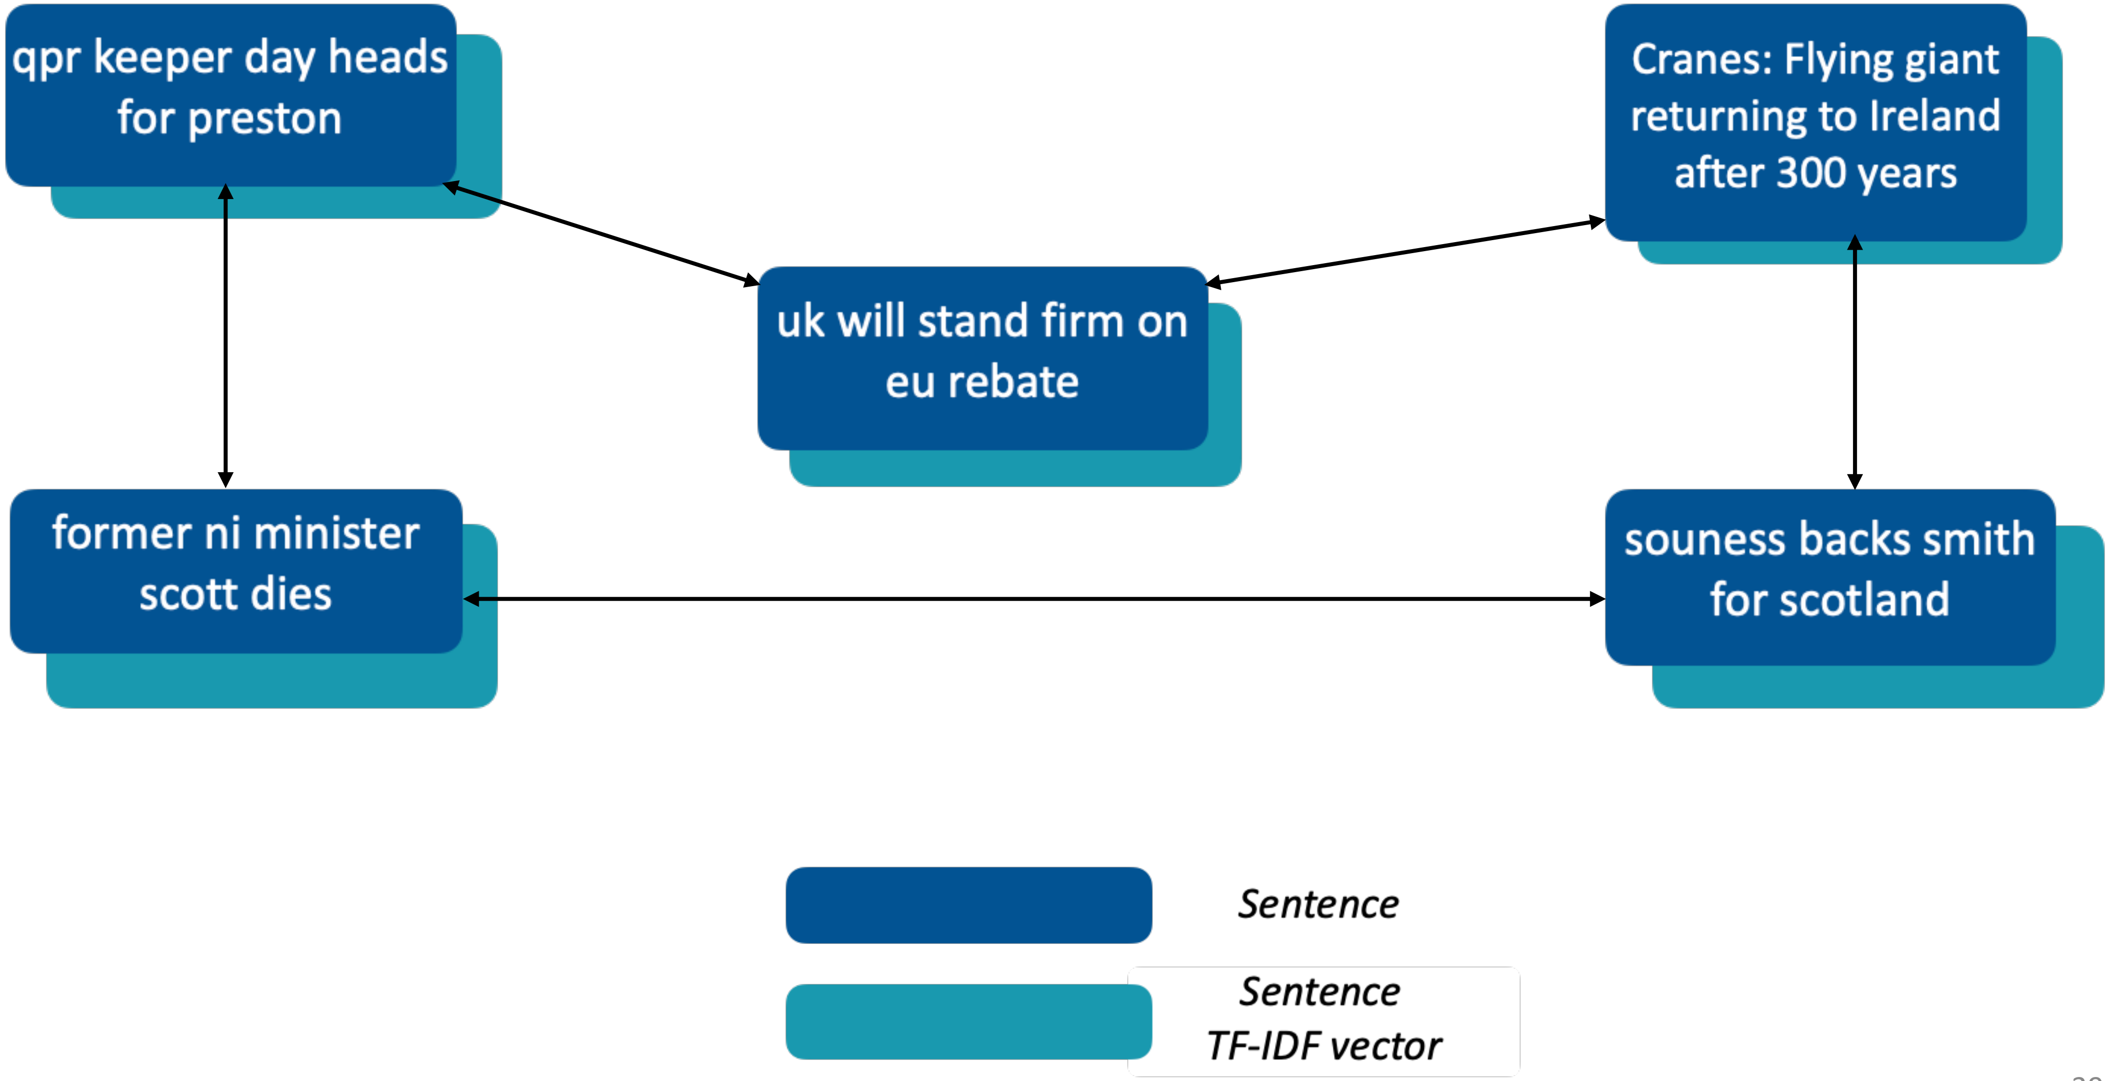


There was the $5 million Deutsche Bank Championship to prepare for and the Ryder Cup is a few weeks away, but the first order of business for Jim Furyk yesterday was to make sure his wife and children were headed for safety.

A sports psychologist says how footballers should prepare themselves for the high-pressure penalties.

Dolphin groups, or "pods", rely on socialites to keep them from collapsing, scientists claim.

Static Graph Construction: Similarity Graph



qpr keeper day heads for preston

Cranes: Flying giant returning to Ireland after 300 years

uk will stand firm on eu rebate

former ni minister scott dies

souness backs smith for scotland

Sentence

Sentence TF-IDF vector

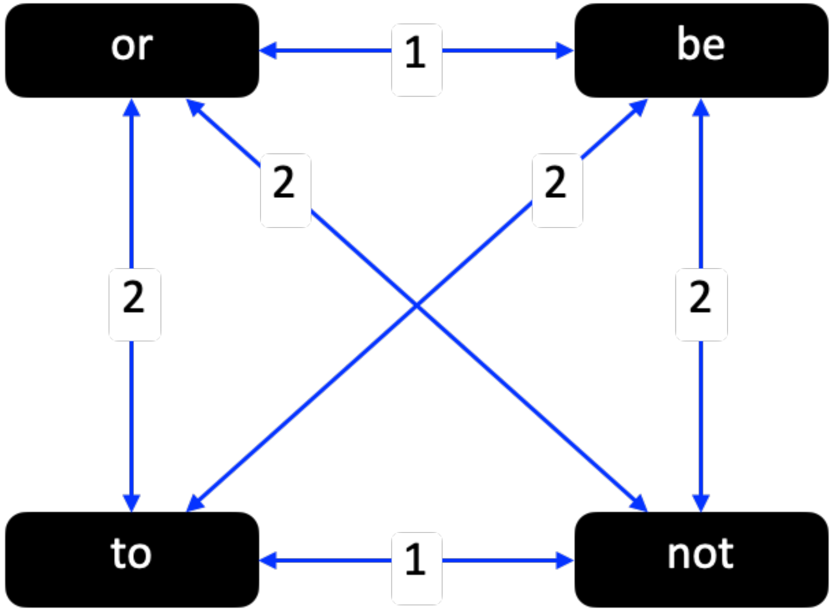
Static Graph Construction: Co-occurrence Graph

***Text input**: To be, or not to be: ...*

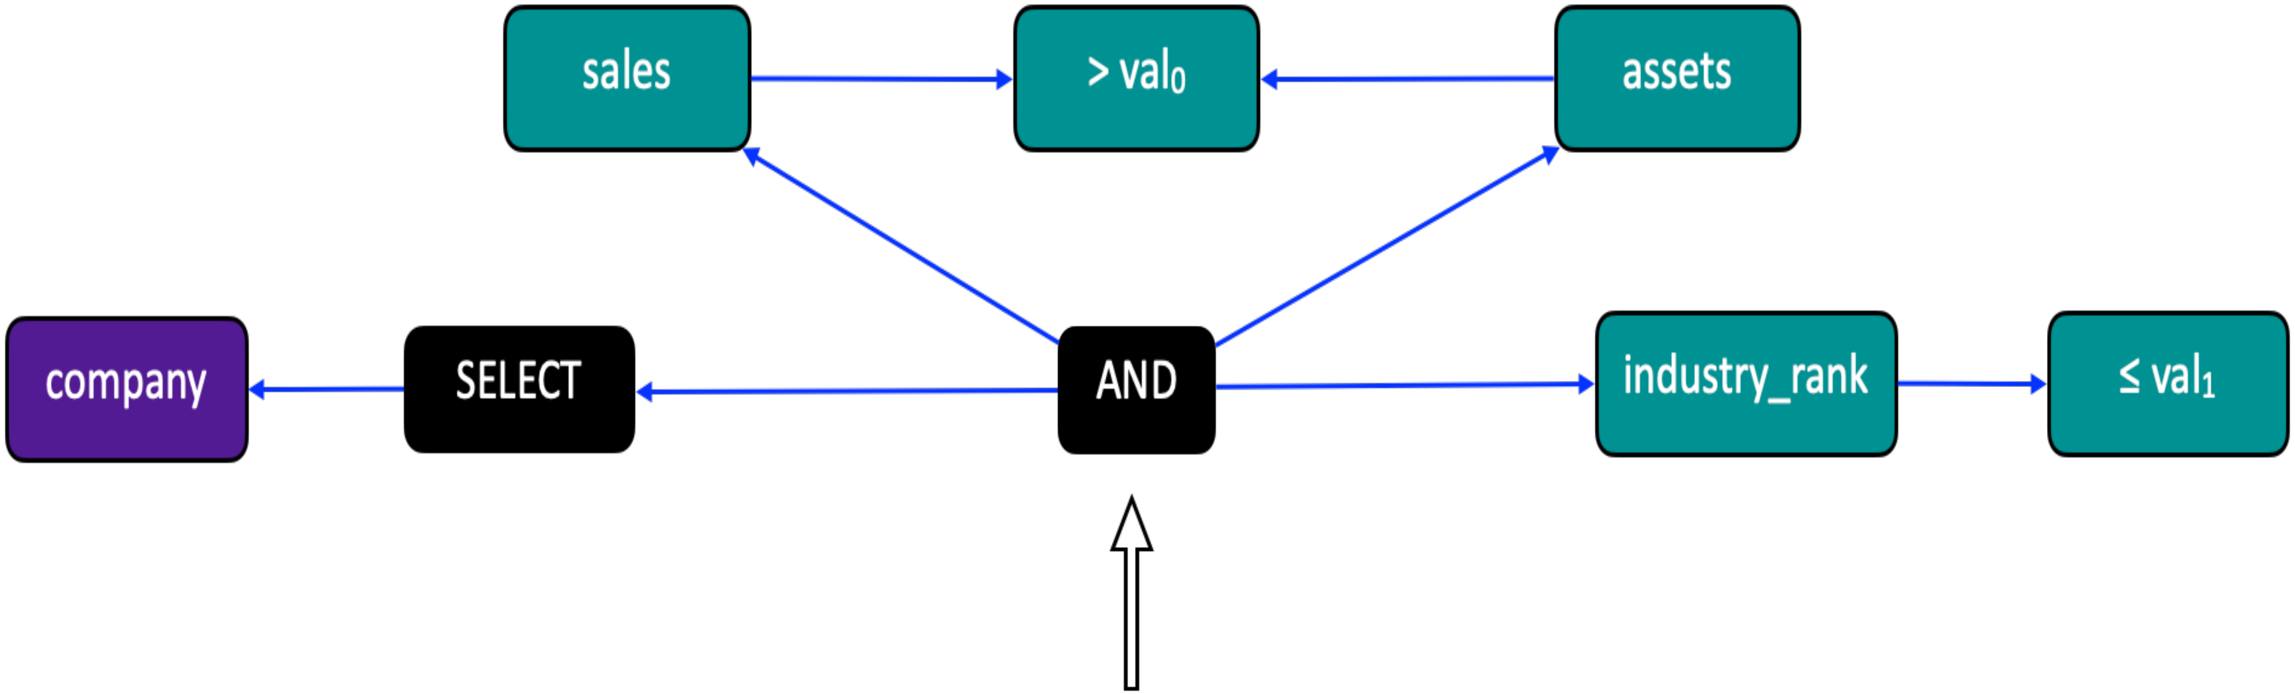
Co-occurrence matrix

	to	be	or	not
to		2	2	1
be	2		1	2
or	2	1		1
not	1	2	1	

Co-occurrence graph

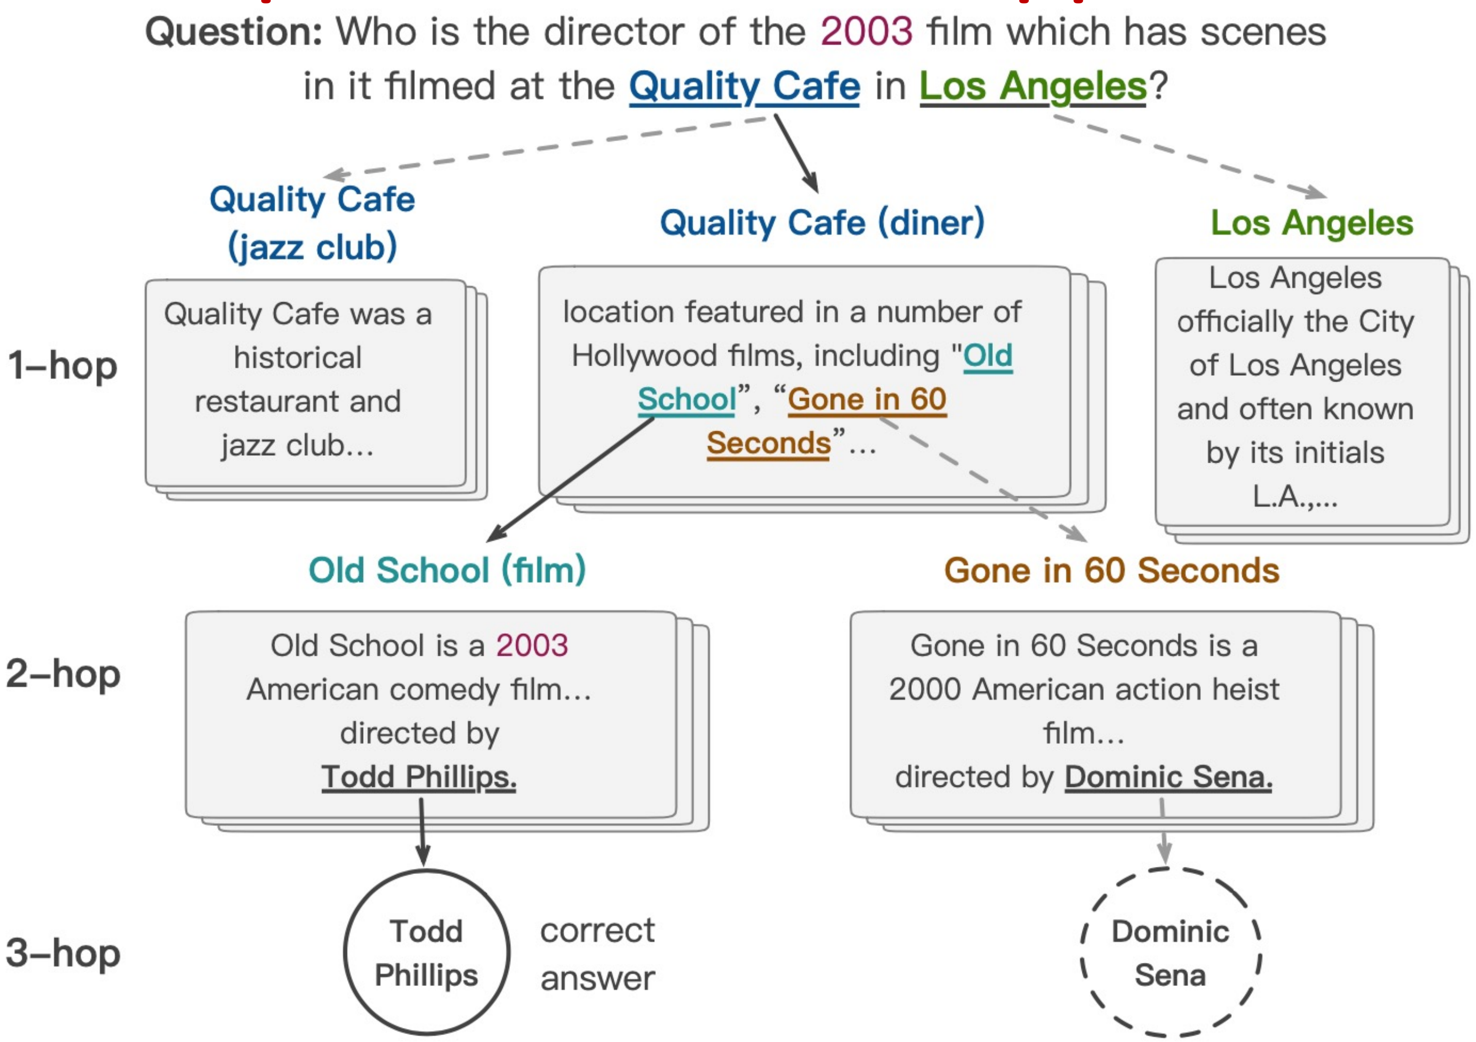


Static Graph Construction: SQL Graph



***SQL query input**: **SELECT** company **WHERE** assets > val_0 **AND** sales > val_0 **AND** industry_rank ≤ val_1*

Static Graph Construction: Application-driven Graph

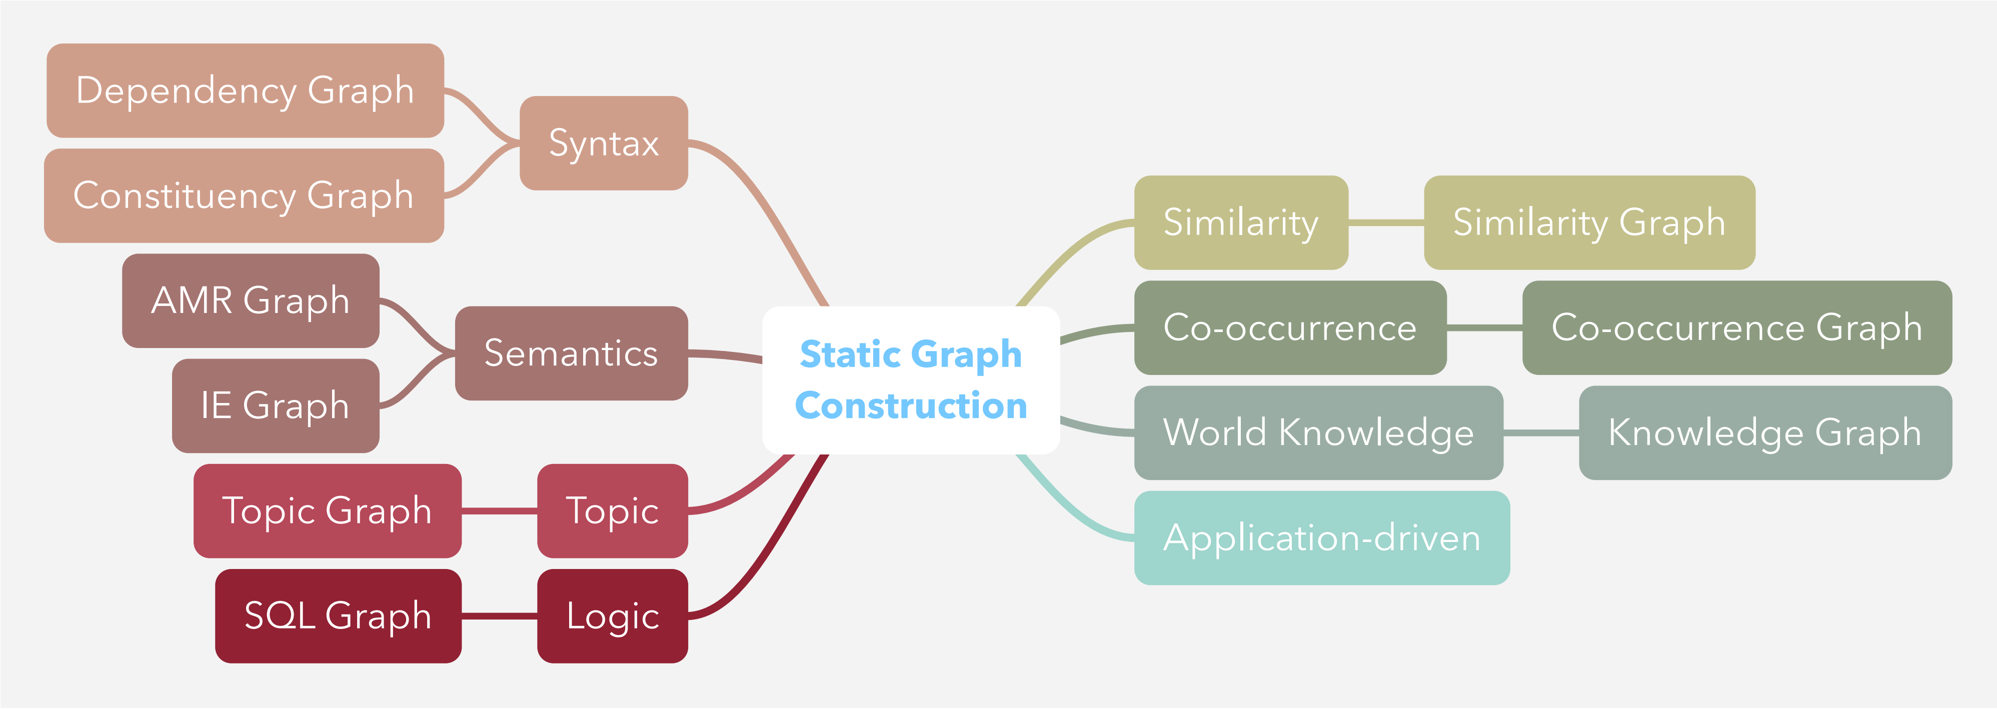


Question: Who is the director of the 2003 film which has scenes in it filmed at the Quality Cafe in Los Angeles?
Quality Cafe (jazz club)
Quality Cafe (diner)
Los Angeles
1–hop
Quality Cafe was a historical restaurant and jazz club…
location featured in a number of Hollywood films, including "Old School", "Gone in 60 Seconds"…
Los Angeles officially the City of Los Angeles and often known by its initials L.A.,…
Old School (film)
Gone in 60 Seconds
2–hop
Old School is a 2003 American comedy film… directed by Todd Phillips.
Gone in 60 Seconds is a 2000 American action heist film… directed by Dominic Sena.
3–hop
Todd Phillips
correct answer
Dominic Sena

Ming Ding et al. "Cognitive Graph for Multi-Hop Reading Comprehension at Scale". ACL 2019.

Graph4NLP

Static Graph Construction: Summary

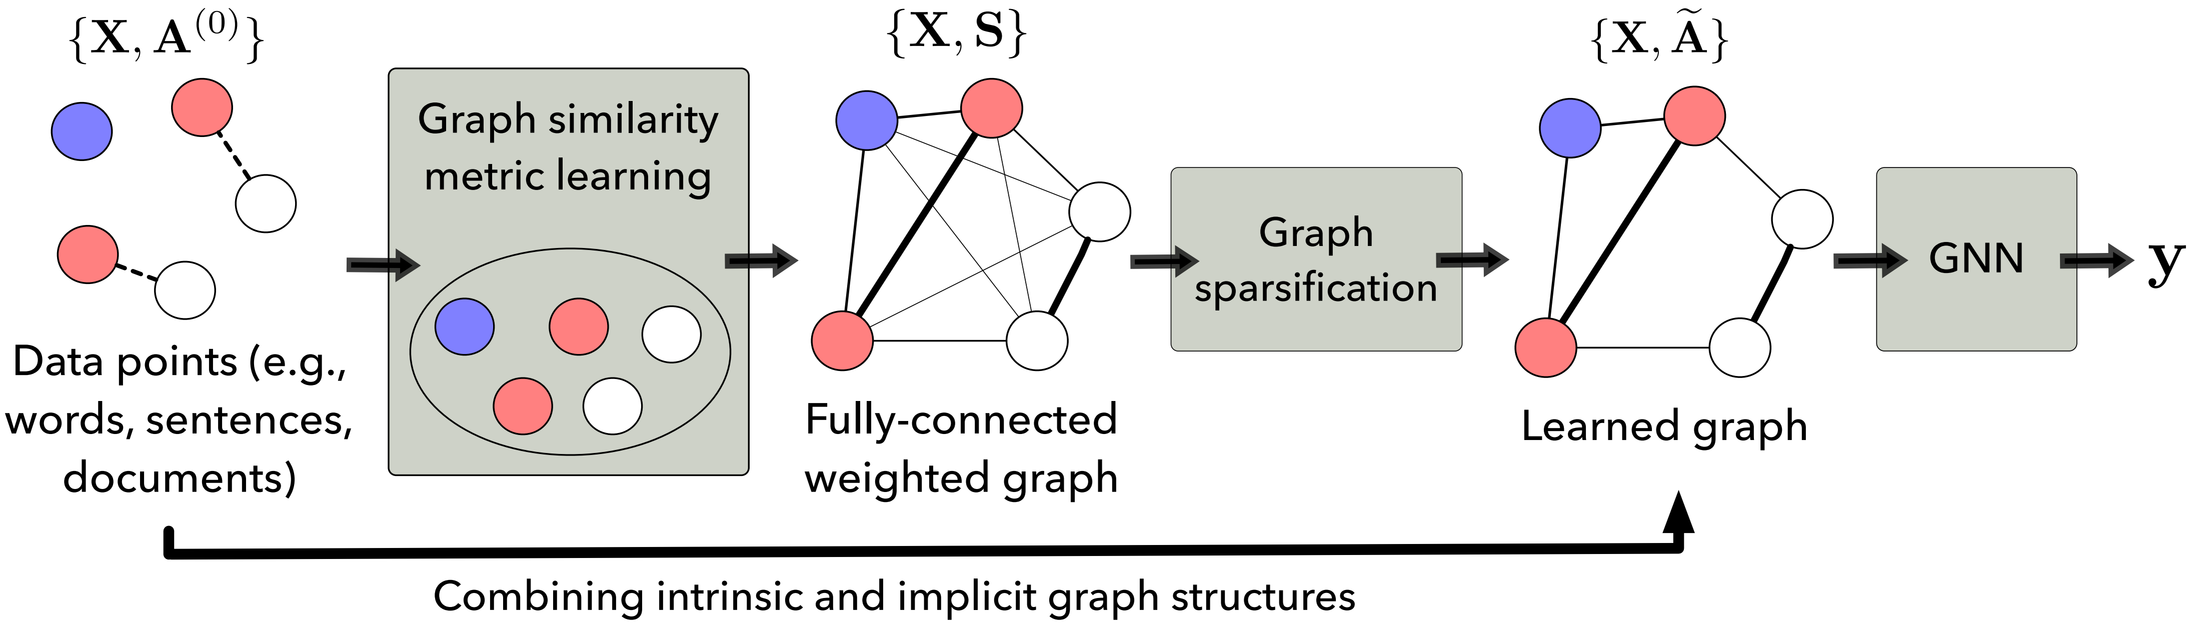


Widely used in various NLP applications such as NLG, MRC, semantic parsing, etc.

Dynamic Graph Construction

- Problem setting:
  - Input: raw text (e.g., sentence, paragraph, document, corpus)
  - Output: graph
- Graph structure (adjacency matrix) learning on the fly, joint with graph representation learning

Dynamic Graph Construction: Overview



$\{\mathbf{X}, \mathbf{A}^{(0)}\}$

Data points (e.g., words, sentences, documents)

Graph similarity metric learning

$\{\mathbf{X}, \mathbf{S}\}$

Fully-connected weighted graph

Graph sparsification

$\{\mathbf{X}, \widetilde{\mathbf{A}}\}$

Learned graph

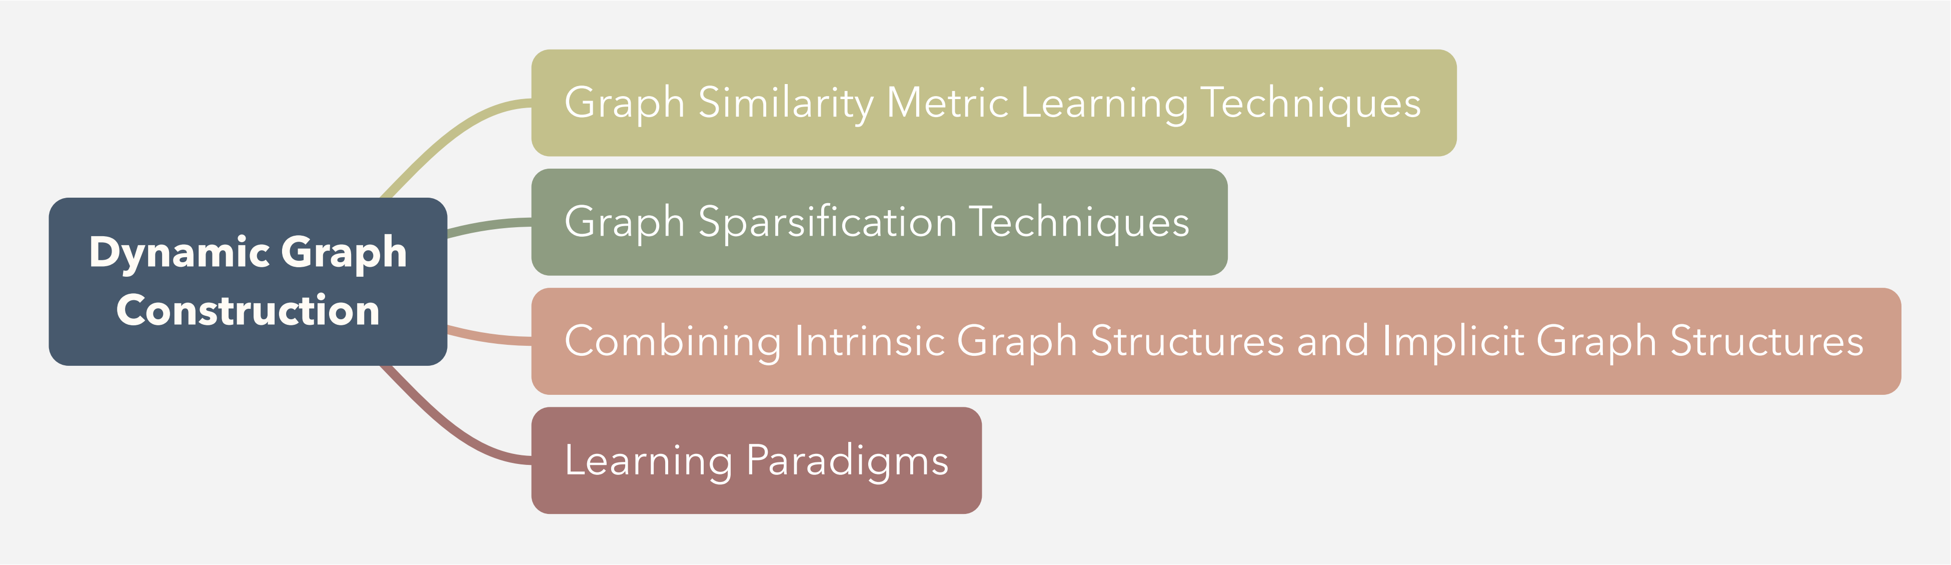
GNN

$\mathbf{y}$

Combining intrinsic and implicit graph structures

Graph4NLP

Dynamic Graph Construction Outline



Dynamic Graph Construction

Graph Similarity Metric Learning Techniques

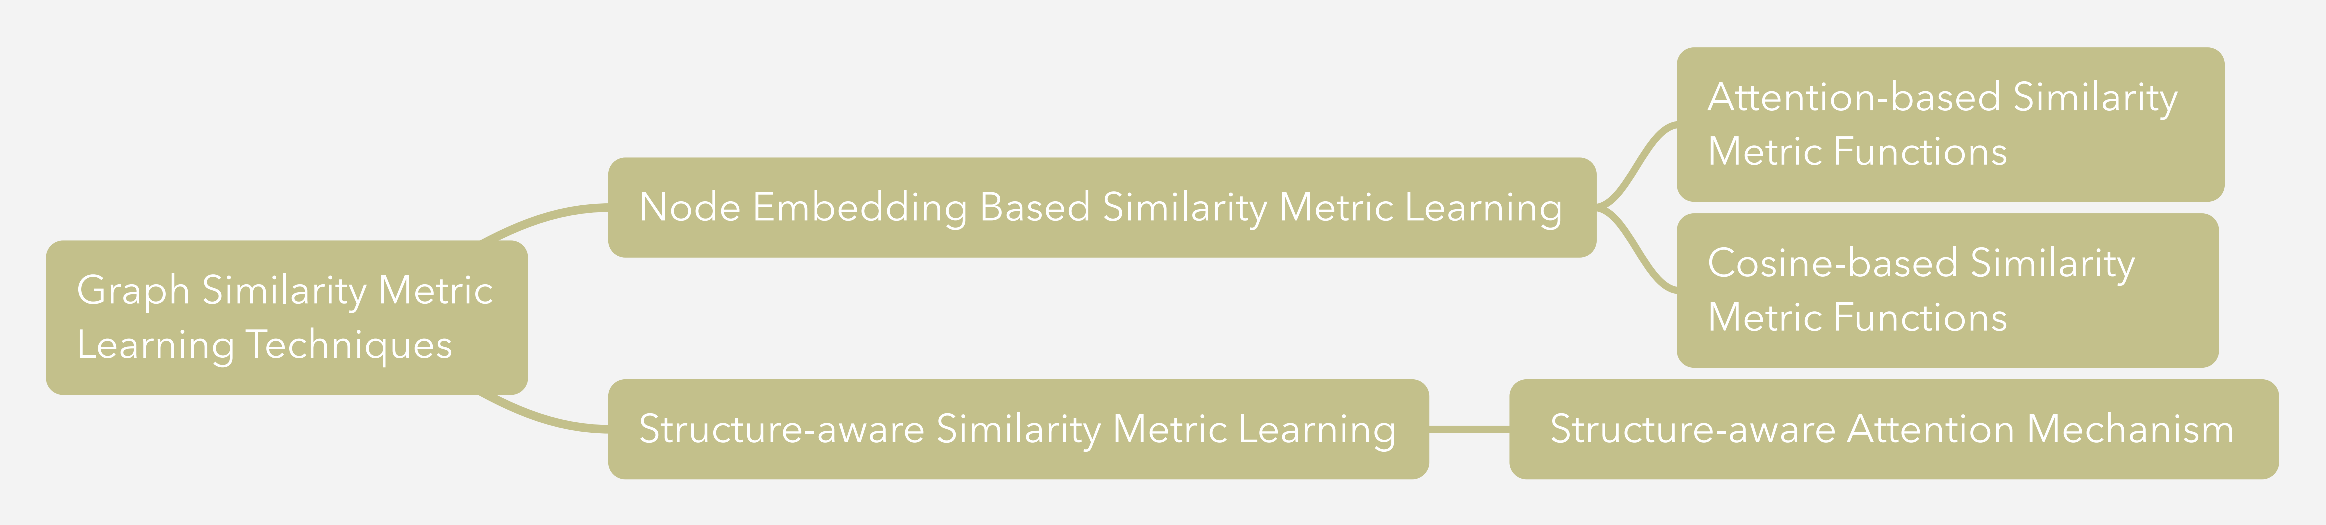
Graph Sparsification Techniques

Combining Intrinsic Graph Structures and Implicit Graph Structures

Learning Paradigms

Graph Similarity Metric Learning Techniques

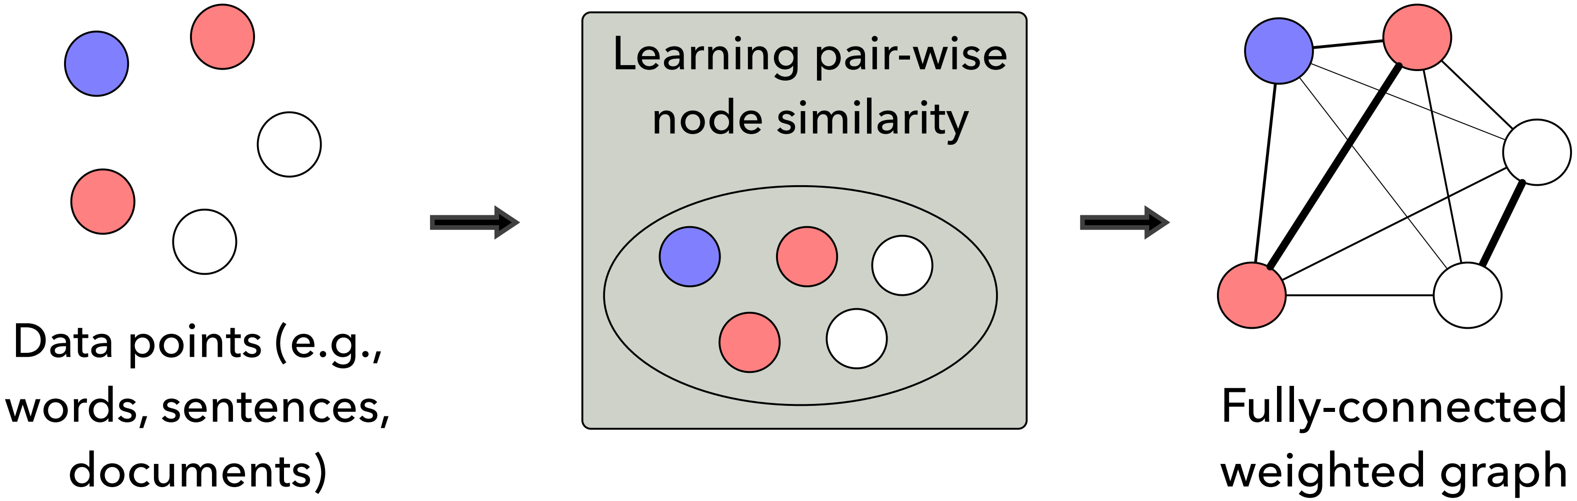
- Graph structure learning as similarity metric learning (in the node embedding space)
- Enabling inductive learning
- Various metric functions



Graph Similarity Metric Learning Techniques
Node Embedding Based Similarity Metric Learning
Attention-based Similarity Metric Functions
Cosine-based Similarity Metric Functions
Structure-aware Similarity Metric Learning
Structure-aware Attention Mechanism

Node Embedding Based Similarity Metric Learning

- Learning a weighted adjacency matrix by computing the pair-wise node similarity in the embedding space
- Common metrics functions
    - Attention-based similarity metric functions
    - Cosine-based similarity metric functions



Data points (e.g., words, sentences, documents)

Learning pair-wise node similarity

Fully-connected weighted graph

Attention-based Similarity Metric Functions

Variant 1)

$$S_{i,j} = (\mathbf{v}_i \odot \mathbf{u})^T \mathbf{v}_j$$

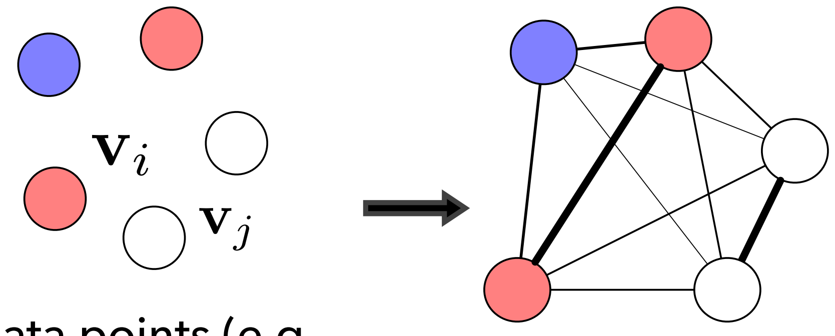
Node feature vector

Non-negative learnable weight vector

Variant 2)

$$S_{i,j} = \mathrm{ReLU}(\mathbf{W}\mathbf{v}_i)^T \mathrm{ReLU}(\mathbf{W}\mathbf{v}_j)$$

Learnable weight matrix



Data points (e.g., words, sentences, documents)

Fully-connected weighted graph

Chen at al. "GraphFlow: Exploiting Conversation Flow with Graph Neural Networks for Conversational Machine Comprehension". IJCAI 2020.

Chen et al. "Reinforcement Learning Based Graph-to-Sequence Model for Natural Question Generation". ICLR 2020.

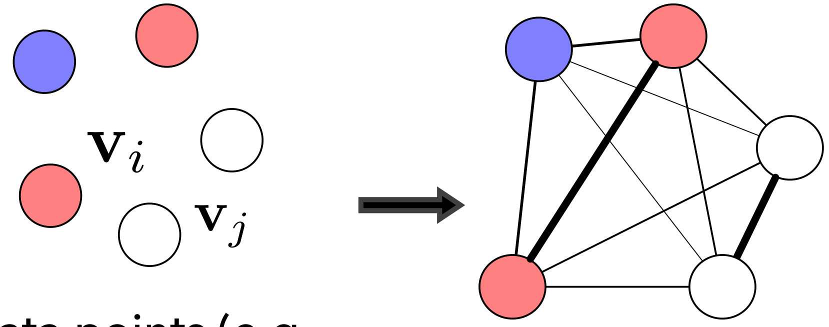
Cosine-based Similarity Metric Functions

$$S_{i,j}^{p} = \cos(\mathbf{w}_p \odot \mathbf{v}_i, \mathbf{w}_p \odot \mathbf{v}_j)$$

Learnable weight vector

$$S_{i,j} = \frac{1}{m} \sum_{p=1}^{m} S_{ij}^{p}$$

Multi-head similarity scores



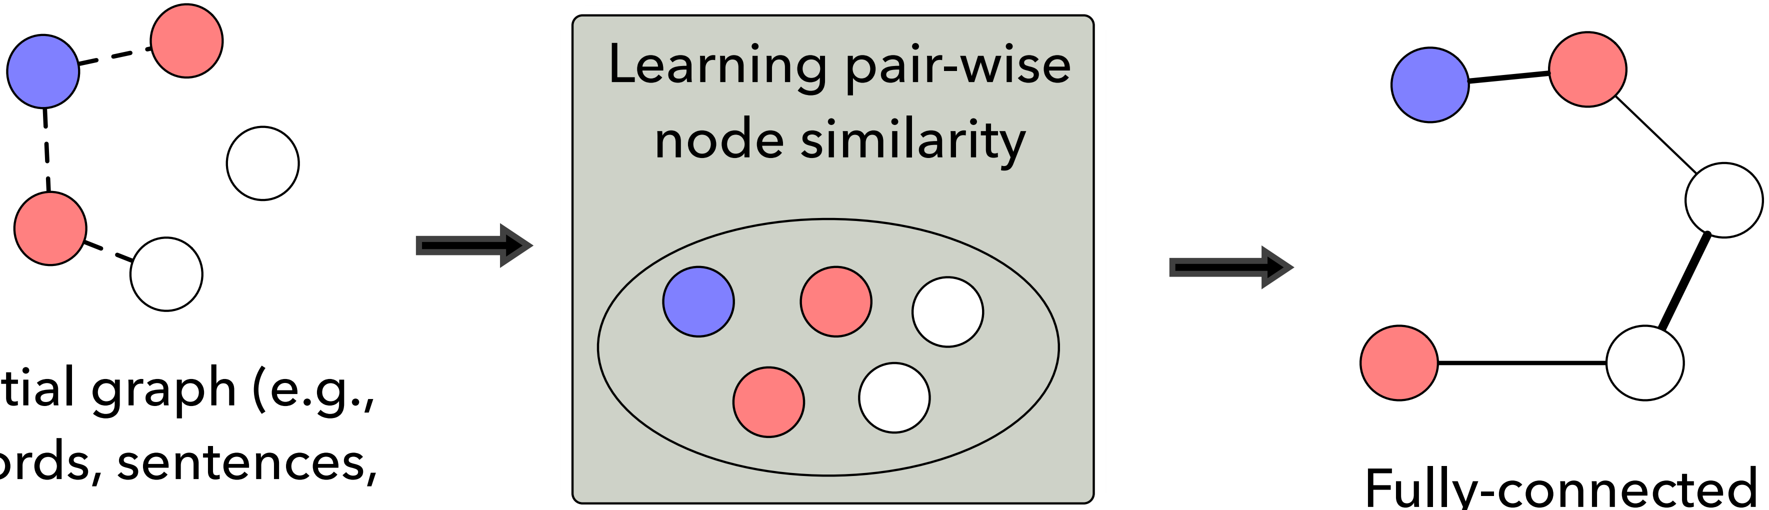
Data points (e.g., words, sentences, documents)

Fully-connected weighted graph

Chen et al. “Iterative Deep Graph Learning for Graph Neural Networks: Better and Robust Node Embeddings”. NeurIPS 2021.

Structure-aware Similarity Metric Learning

- Learning a weighted adjacency matrix by computing the pair-wise node similarity in the embedding space
- Considering existing edge information of the intrinsic graph in addition to the node information



Initial graph (e.g., words, sentences, documents)

Learning pair-wise node similarity

Fully-connected weighted graph

Attention-based Similarity Metric Functions

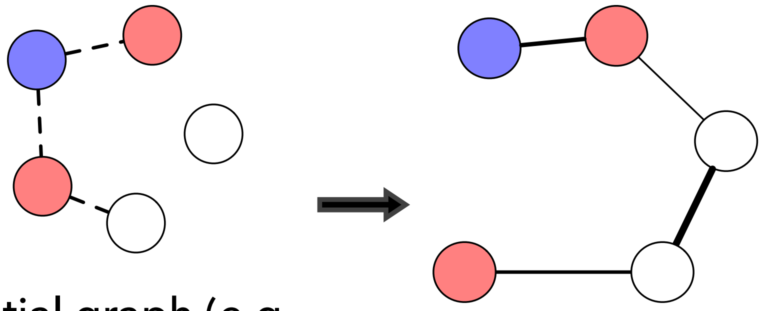
Variant 1)

$$S^{l}_{i,j} = \mathrm{softmax}(\mathbf{u}^{T}\tanh(\mathbf{W}[\mathbf{h}^{l}_{i}, \mathbf{h}^{l}_{j}, \mathbf{v}_{i}, \mathbf{v}_{j}, \mathbf{e}_{i,j}]))$$

Edge embeddings

Variant 2)

$$S_{i,j} = \frac{\mathrm{ReLU}(\mathbf{W}^{Q}\mathbf{v}_{i})^{T}(\mathrm{ReLU}(\mathbf{W}^{K}\mathbf{v}_{i}) + \mathrm{ReLU}(\mathbf{W}^{R}\mathbf{e}_{i,j}))}{\sqrt{d}}$$



Initial graph (e.g., words, sentences, documents)

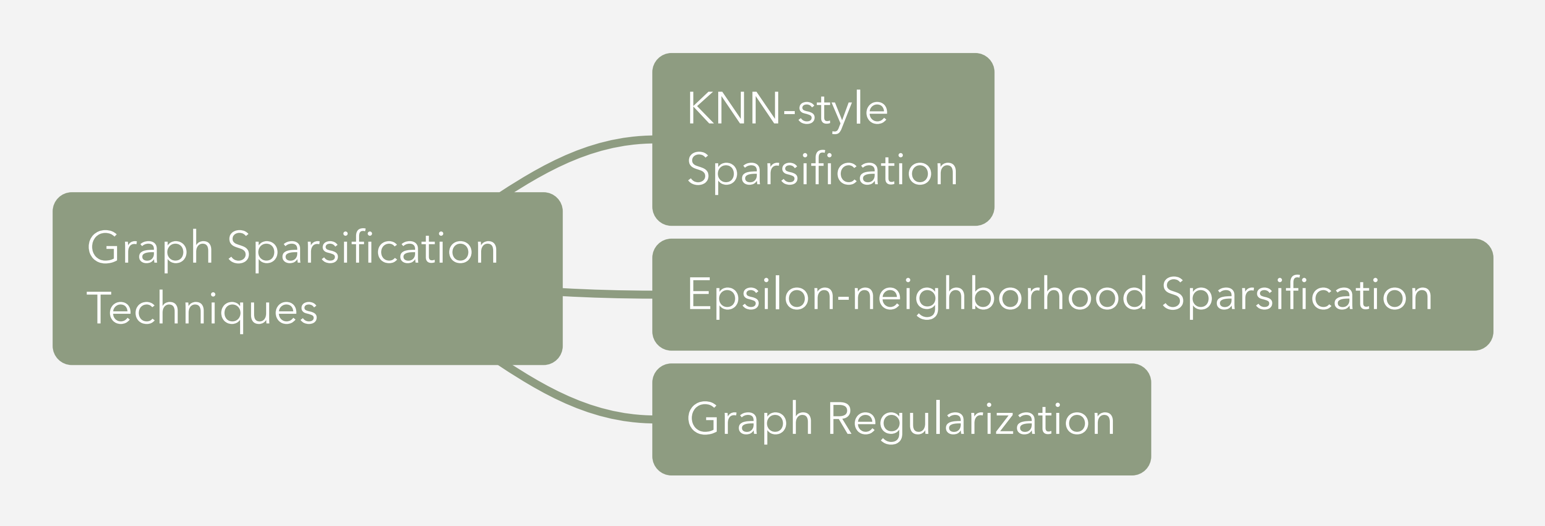
Fully-connected weighted graph

Liu et al. "Contextualized Non-local Neural Networks for Sequence Learning". AAAI 2019.

Liu et al. "Retrieval-Augmented Generation for Code Summarization via Hybrid GNN". ICLR 2021.

Graph Sparsification Techniques

- Similarity metric functions learn a fully-connected graph
- Fully-connected graph is computationally expensive and might introduce noise
- Enforcing sparsity to the learned graph structure
- Various techniques



Graph Sparsification Techniques
KNN-style Sparsification
Epsilon-neighborhood Sparsification
Graph Regularization

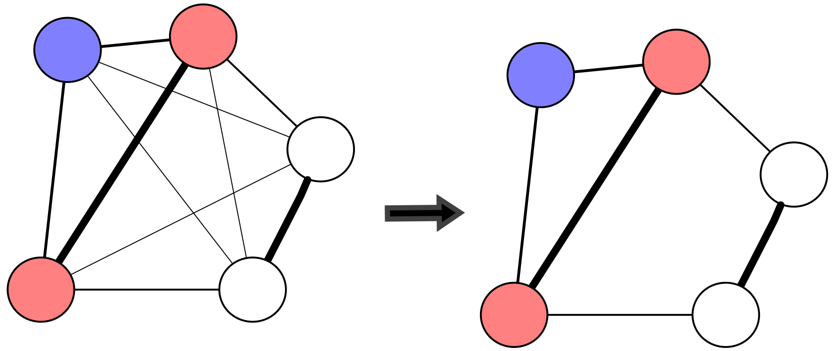
Common Graph Sparsification Options

Option 1) KNN-style Sparsification

$$\mathbf{A}_{i,:} = \mathrm{topk}(\mathbf{S}_{i,:})$$

Option 2) epsilon-neighborhood Sparsification

$$A_{i,j} = \begin{cases} S_{i,j} & S_{i,j} > \varepsilon \\ 0 & \text{otherwise} \end{cases}$$



Fully-connected weighted graph

Sparsified graph

Option 3) graph Regularization

$$\frac{1}{n^2}||A||_F^2$$

Combining Intrinsic and Implicit Graph Structures

- Intrinsic graph typically still carries rich and useful information
- Learned implicit graph is potentially a “shift” (e.g., substructures) from the intrinsic graph structure

$$\widetilde{A} = \lambda L^{(0)} + (1 - \lambda)\mathrm{f}(A)$$

Normalized graph Laplacian

f(A) can be arbitrary operation, e.g., graph Laplacian, row-normalization

Li et al. “Adaptive Graph Convolutional Neural Networks”. AAAI 2018.

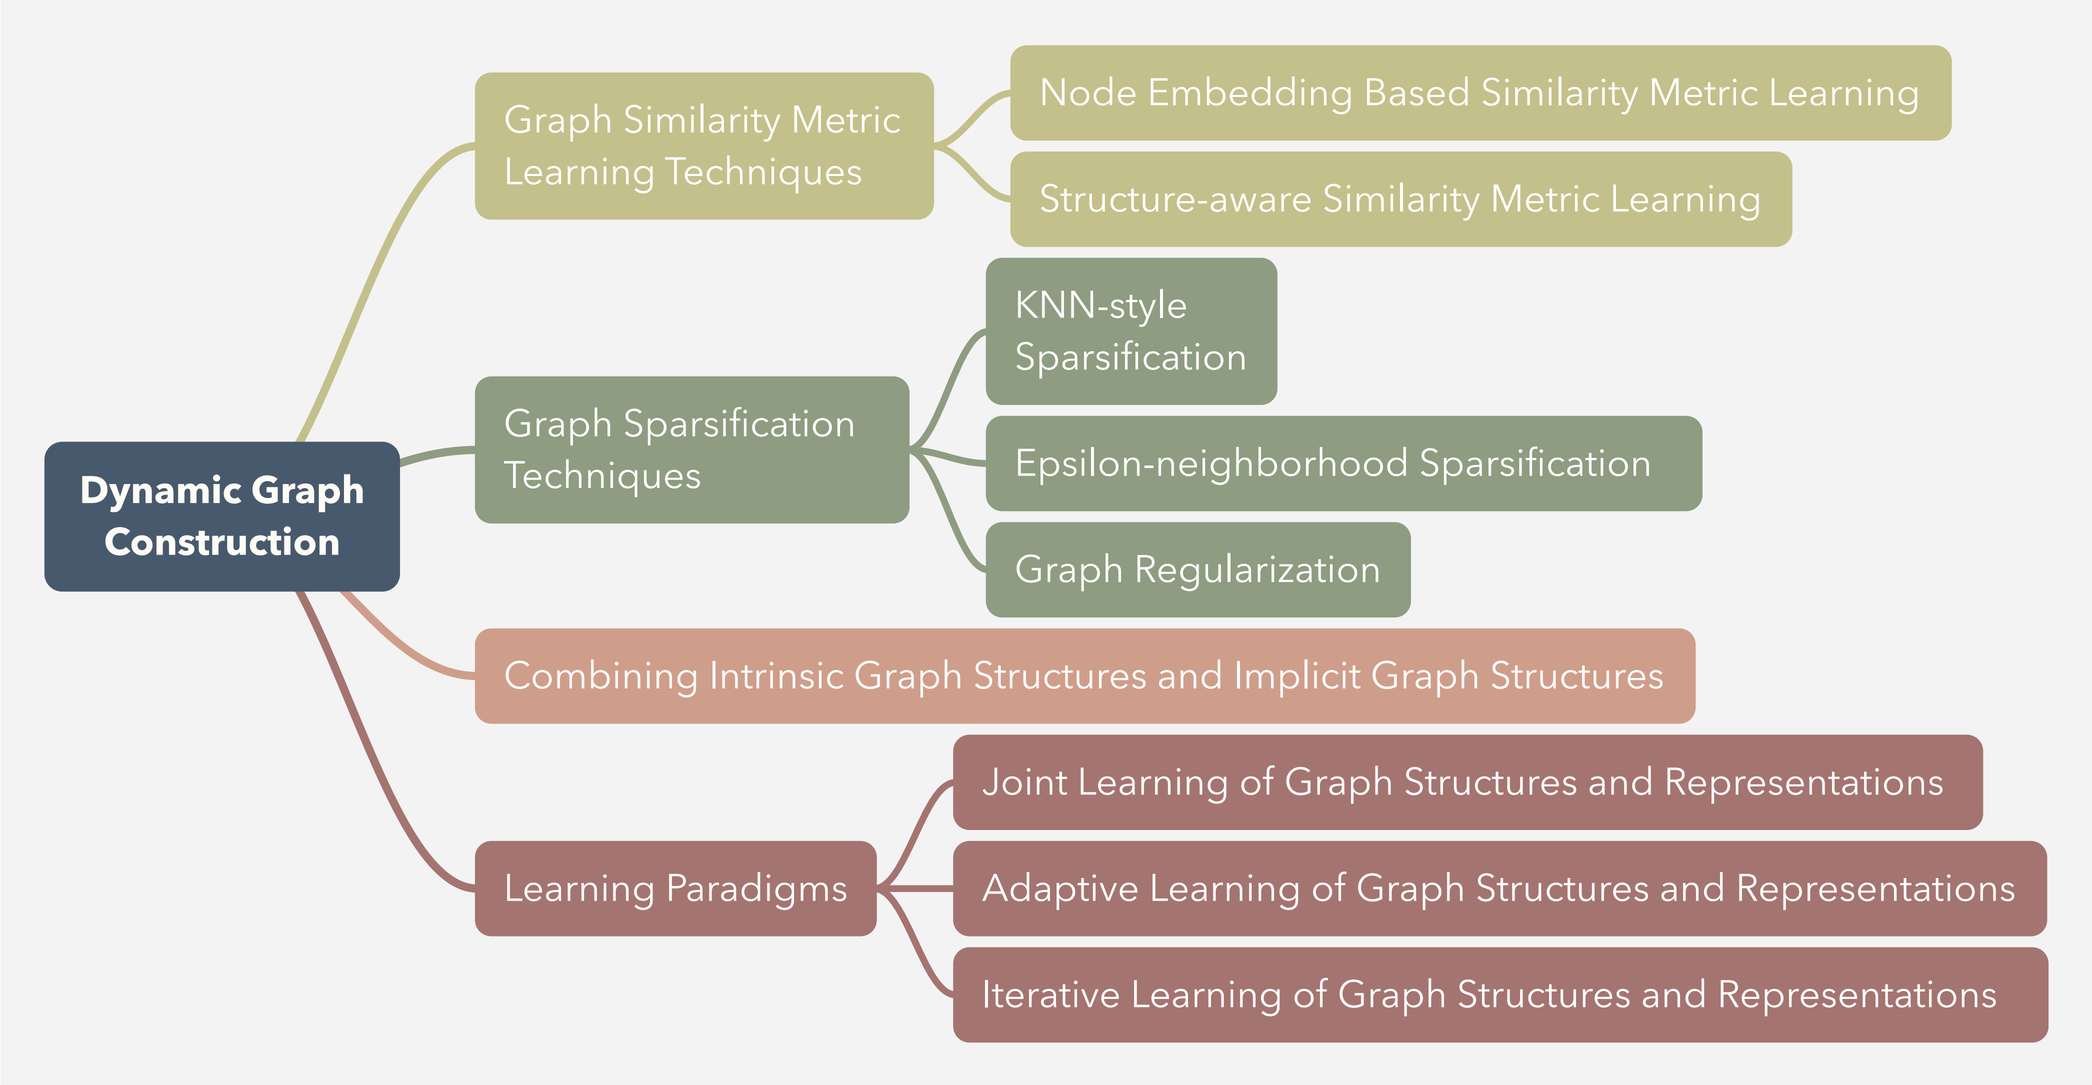
Dynamic Graph Construction Summary



- Dynamic Graph Construction
  - Graph Similarity Metric Learning Techniques
    - Node Embedding Based Similarity Metric Learning
    - Structure-aware Similarity Metric Learning
  - Graph Sparsification Techniques
    - KNN-style Sparsification
    - Epsilon-neighborhood Sparsification
    - Graph Regularization
  - Combining Intrinsic Graph Structures and Implicit Graph Structures
  - Learning Paradigms
    - Joint Learning of Graph Structures and Representations
    - Adaptive Learning of Graph Structures and Representations
    - Iterative Learning of Graph Structures and Representations

Static vs. Dynamic Graph Construction

New topic in DLG4NLP!

Static graph construction	Dynamic graph construction
Pros	Pros
prior knowledge	no domain expertise
	joint graph structure & representation learning
Cons	Cons
extensive domain expertise	scalability
• error-prone (e.g., noisy, incomplete) • sub-optimal	explainability
• disjoint graph structure & representation learning • error accumulation	

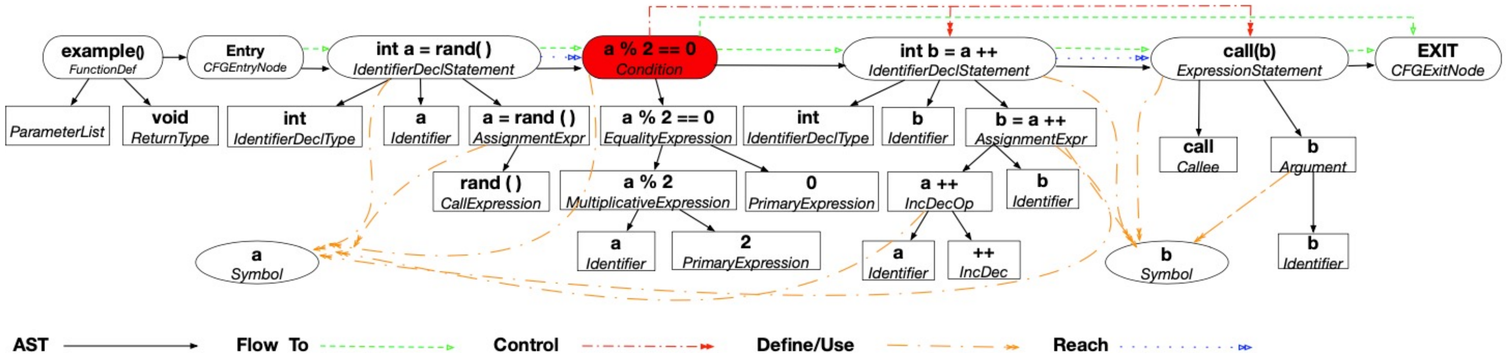
Static vs. Dynamic Graph Construction (cont)

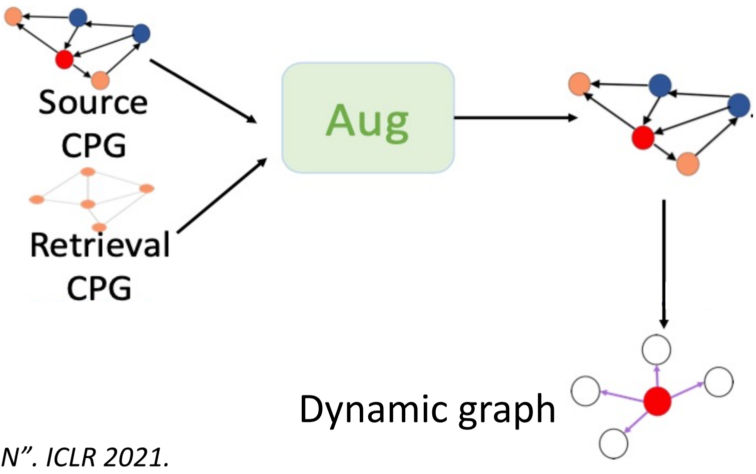
When to use static graph construction

- Domain knowledge which fits the task and can be presented as a graph

When to use dynamic graph construction

- Lack of domain knowledge which fits the task or can be presented as a graph
- Domain knowledge is incomplete or might contain noise
- To learn implicit graph which augments the static graph



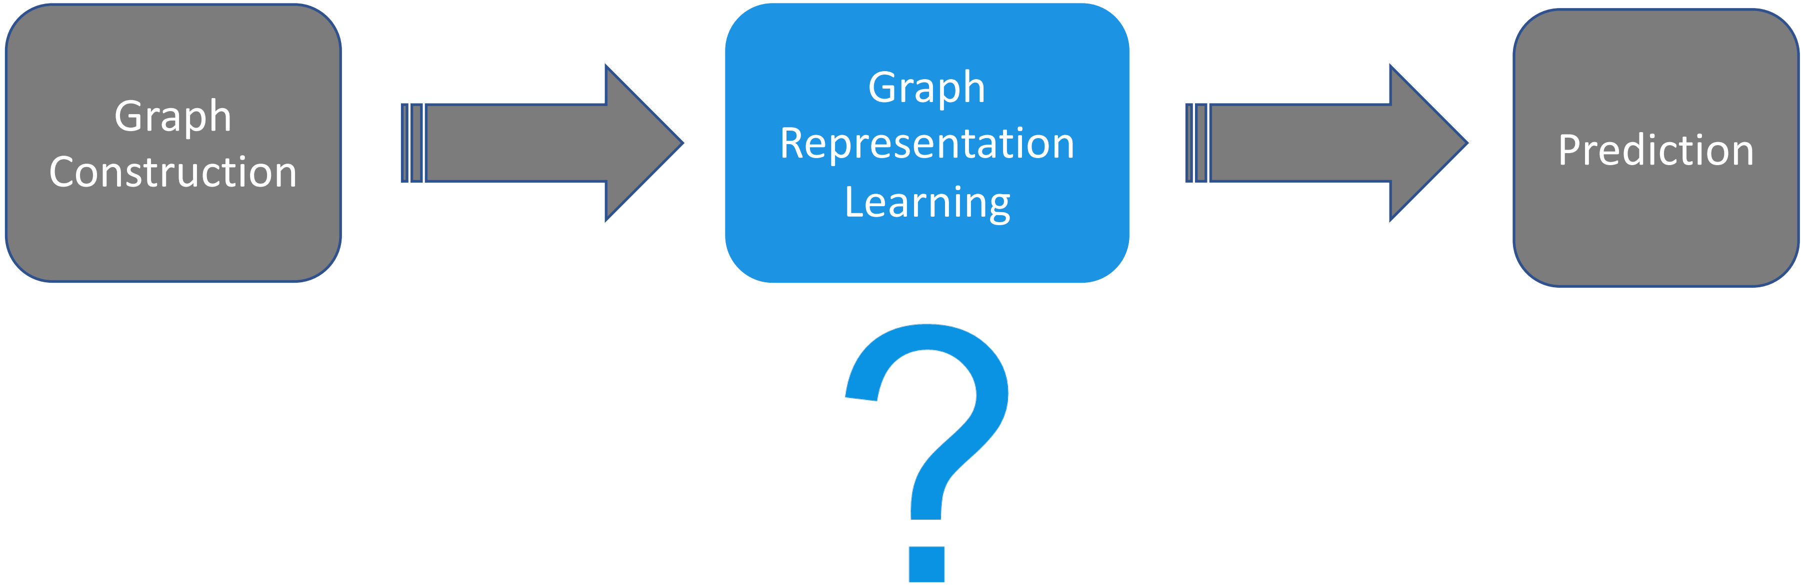


Liu et al. “Retrieval-Augmented Generation for Code Summarization via Hybrid GNN”. ICLR 2021.

Graph Representation Learning for NLP

Graph4NLP

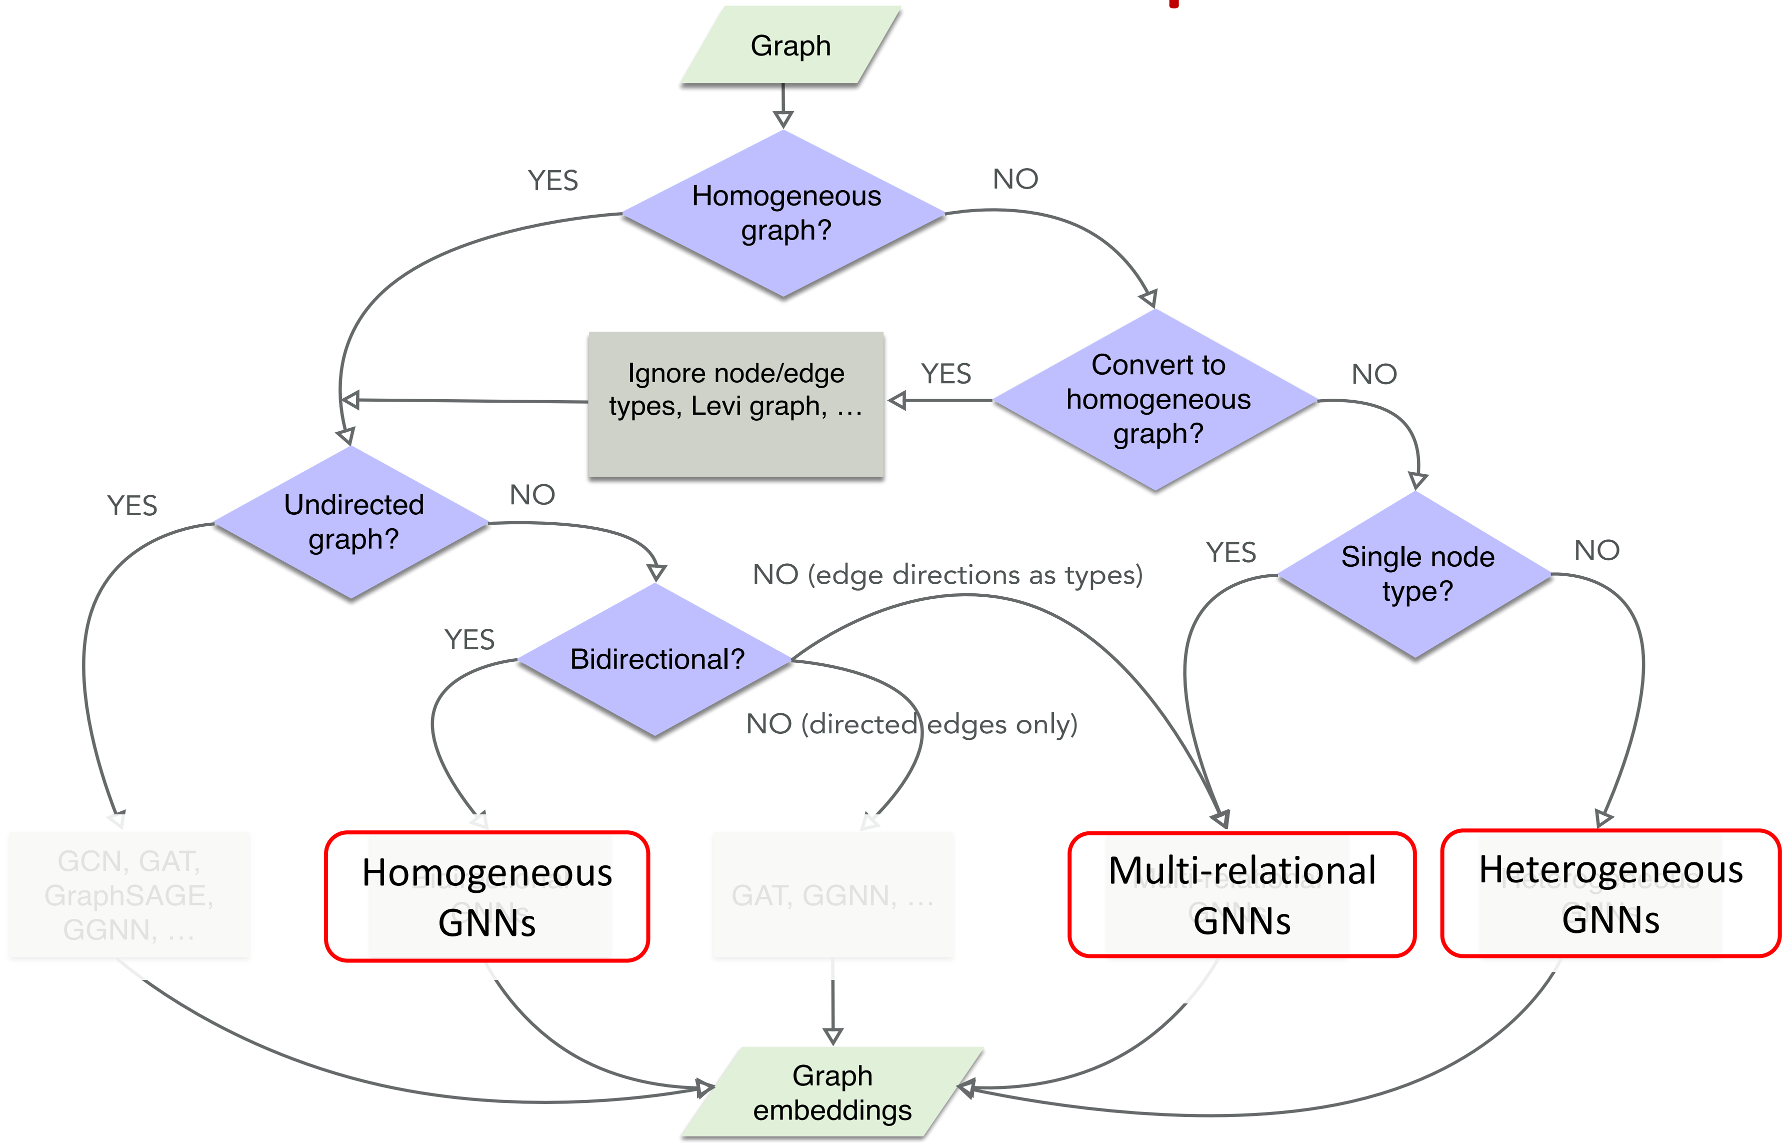
GNNs for Graph Representation Learning



Homogeneous vs Multi-relational vs Heterogeneous Graphs

Graph types	Homogeneous	Multi-relational	Heterogeneous
# of node types	1	1	> 1
# of edge types	1	> 1	>= 1

Which GNNs to Use Given a Graph?



Graph

Homogeneous graph?

YES

NO

Convert to homogeneous graph?

YES

Ignore node/edge types, Levi graph, …

NO

Single node type?

YES

NO

Undirected graph?

YES

NO

Bidirectional?

YES

NO (edge directions as types)

NO (directed edges only)

GCN, GAT, GraphSAGE, GGNN, …

Homogeneous GNNs

GAT, GGNN, …

Multi-relational GNNs

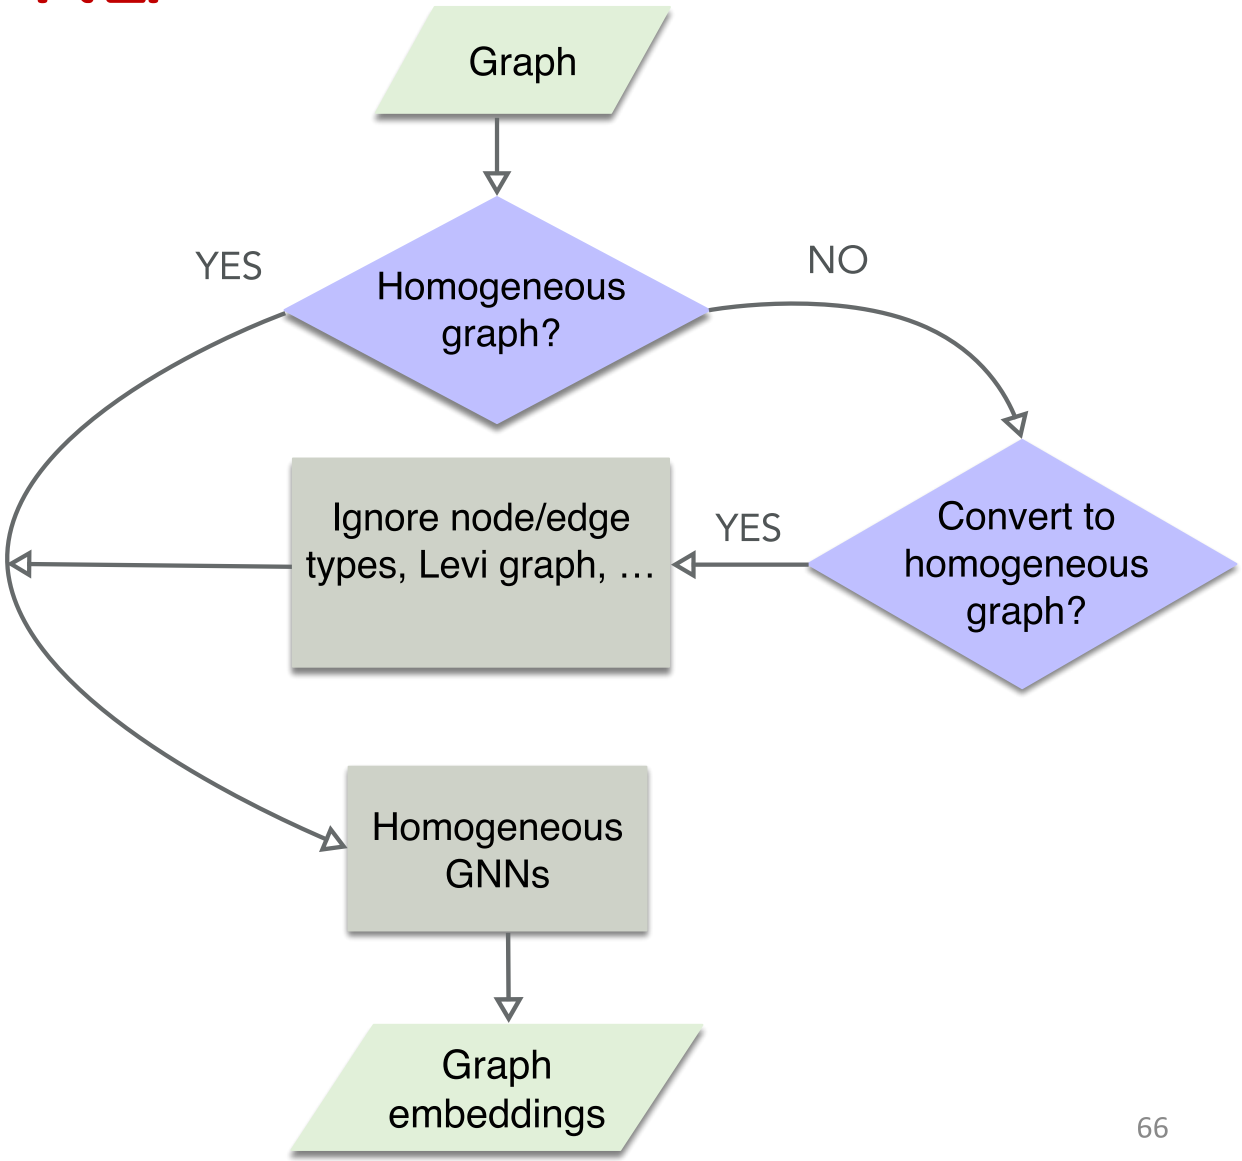
Heterogeneous GNNs

Graph embeddings

Graph4NLP

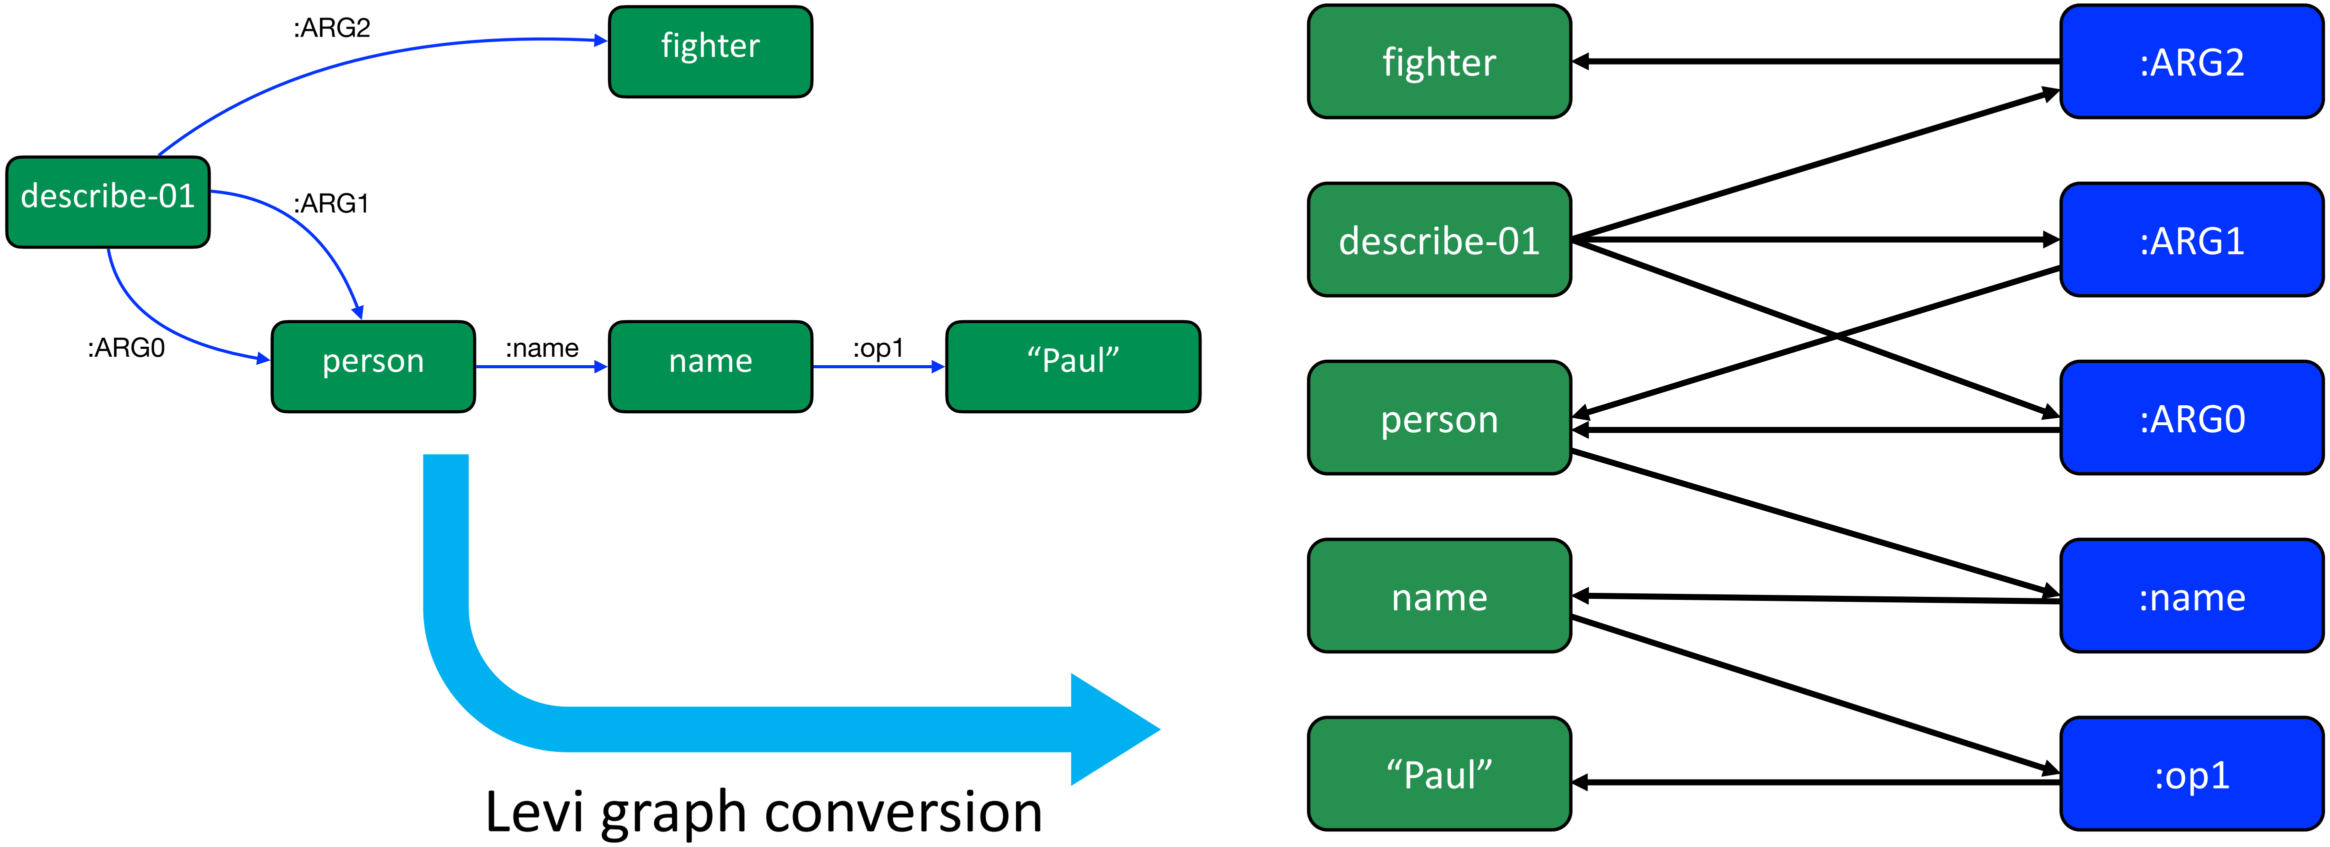
Homogeneous GNNs for NLP

- When to use homogeneous GNNs?
- Homogeneous GNNs
  - GCN
  - GAT
  - GraphSAGE
  - GGNN
  - …



Graph
YES
Homogeneous graph?
NO
Ignore node/edge types, Levi graph, …
YES
Convert to homogeneous graph?
Homogeneous GNNs
Graph embeddings

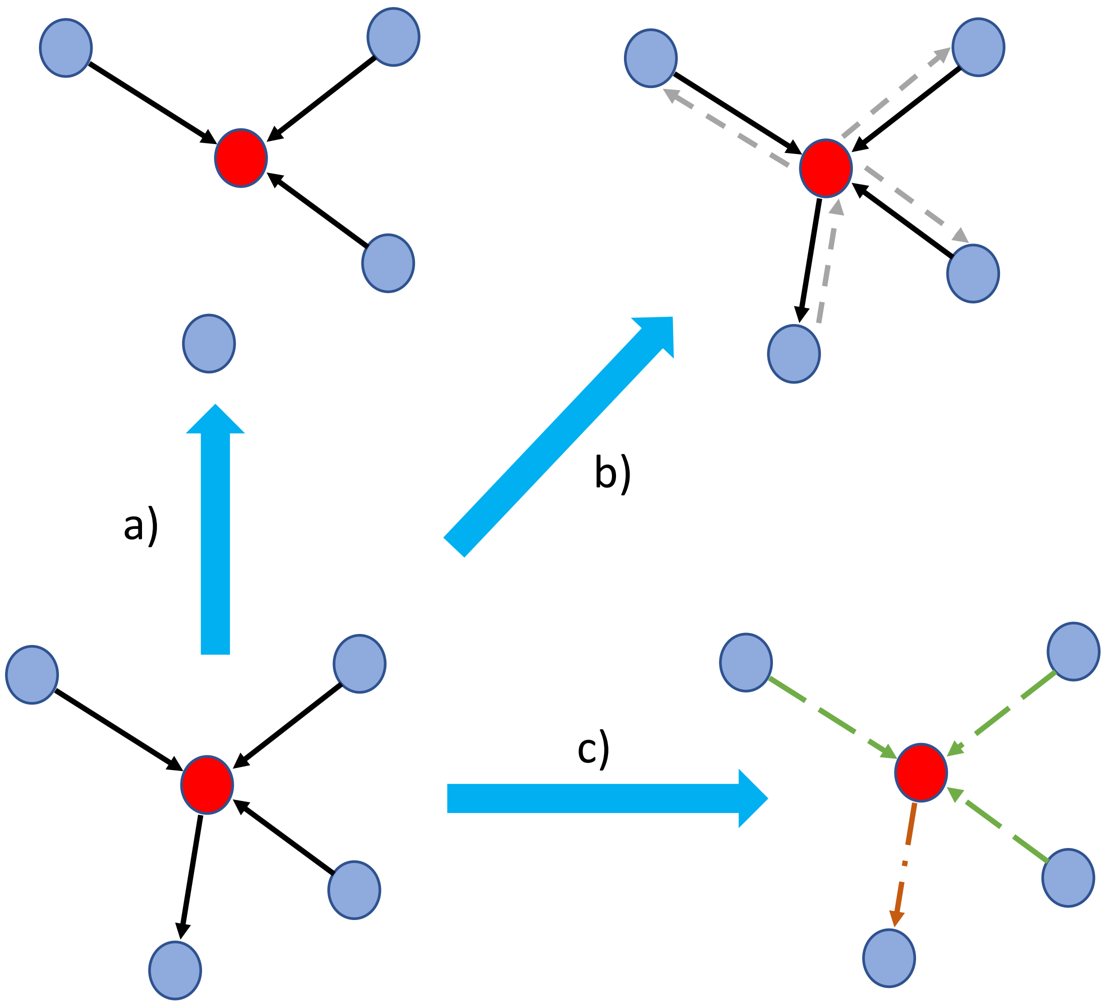
Non-homogeneous to Homogeneous Conversion via Levi Graph



Levi graph: edges as new nodes

How to Handle Edge Direction Information?

- Edge direction is important (think about BiLSTM, BERT)
- Common strategies for handling directed graphs
  a) Message passing only along directed edges (e.g., GAT, GGNN)
  b) Regarding edge directions as edge types (i.e., adding “reverse” edges)
  c) Bidirectional GNNs



Edge Directions as Edge Types

- Regarding edge directions as edge types, resulting in a multi-relational graph

$$dir_{i,j} = \begin{cases} default, & e_{i,j} \text{ is originally existing in the graph} \\ inverse, & e_{i,j} \text{ is the inverse edge} \\ self, & i = j \end{cases}$$

Then we can apply multi-relational GNNs

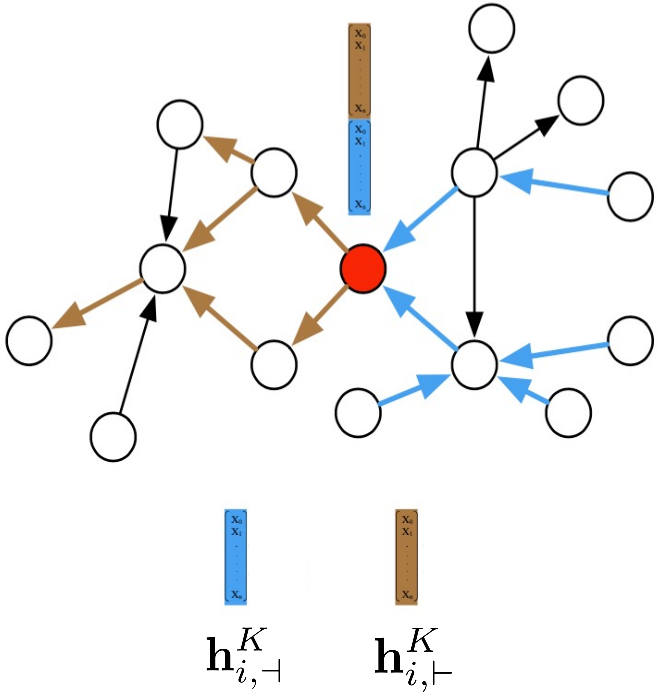
Bidirectional GNNs for Directed Graphs

Bi-Sep GNNs formulation:

Run multi-hop backward/forward GNN on the graph

$$\mathbf{h}_{i,\dashv}^{k} = GNN(\mathbf{h}_{i,\dashv}^{k-1}, \{\mathbf{h}_{j,\dashv}^{k-1} : \forall v_j \in \mathcal{N}_{\dashv}(v_i)\})$$

$$\mathbf{h}_{i,\vdash}^{k} = GNN(\mathbf{h}_{i,\vdash}^{k-1}, \{\mathbf{h}_{j,\vdash}^{k-1} : \forall v_j \in \mathcal{N}_{\vdash}(v_i)\})$$



Concatenate backward/forward node embeddings at last hop

$$\mathbf{h}_{i}^{K} = \mathbf{h}_{i,\dashv}^{K} || \mathbf{h}_{i,\vdash}^{K}$$

Xu et al. "Graph2Seq: Graph to Sequence Learning with Attention-based Neural Networks". 2018.

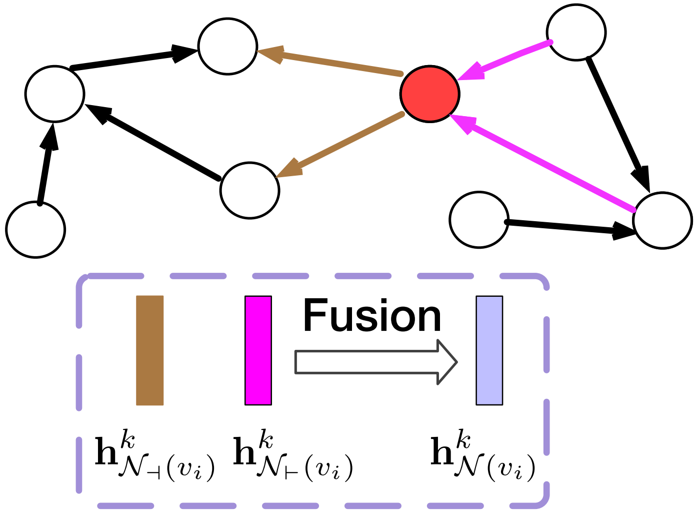
Bidirectional GNNs for Directed Graphs (cont)

Bi-Fuse GNNs formulation:

Run one-hop backward/forward node aggregation

$$\mathbf{h}^k_{\mathcal{N}_{\dashv}(v_i)} = AGG(\mathbf{h}^{k-1}_i, \{\mathbf{h}^{k-1}_j : \forall v_j \in \mathcal{N}_{\dashv}(v_i)\})$$

$$\mathbf{h}^k_{\mathcal{N}_{\vdash}(v_i)} = AGG(\mathbf{h}^{k-1}_i, \{\mathbf{h}^{k-1}_j : \forall v_j \in \mathcal{N}_{\vdash}(v_i)\})$$



Fusion
$\mathbf{h}^k_{\mathcal{N}_{\dashv}(v_i)}$
$\mathbf{h}^k_{\mathcal{N}_{\vdash}(v_i)}$
$\mathbf{h}^k_{\mathcal{N}(v_i)}$

Fuse backward/forward aggregation vectors at each hop

$$\mathbf{h}^k_{\mathcal{N}(v_i)} = Fuse(\mathbf{h}^k_{\mathcal{N}_{\dashv}(v_i)}, \mathbf{h}^k_{\mathcal{N}_{\vdash}(v_i)})$$

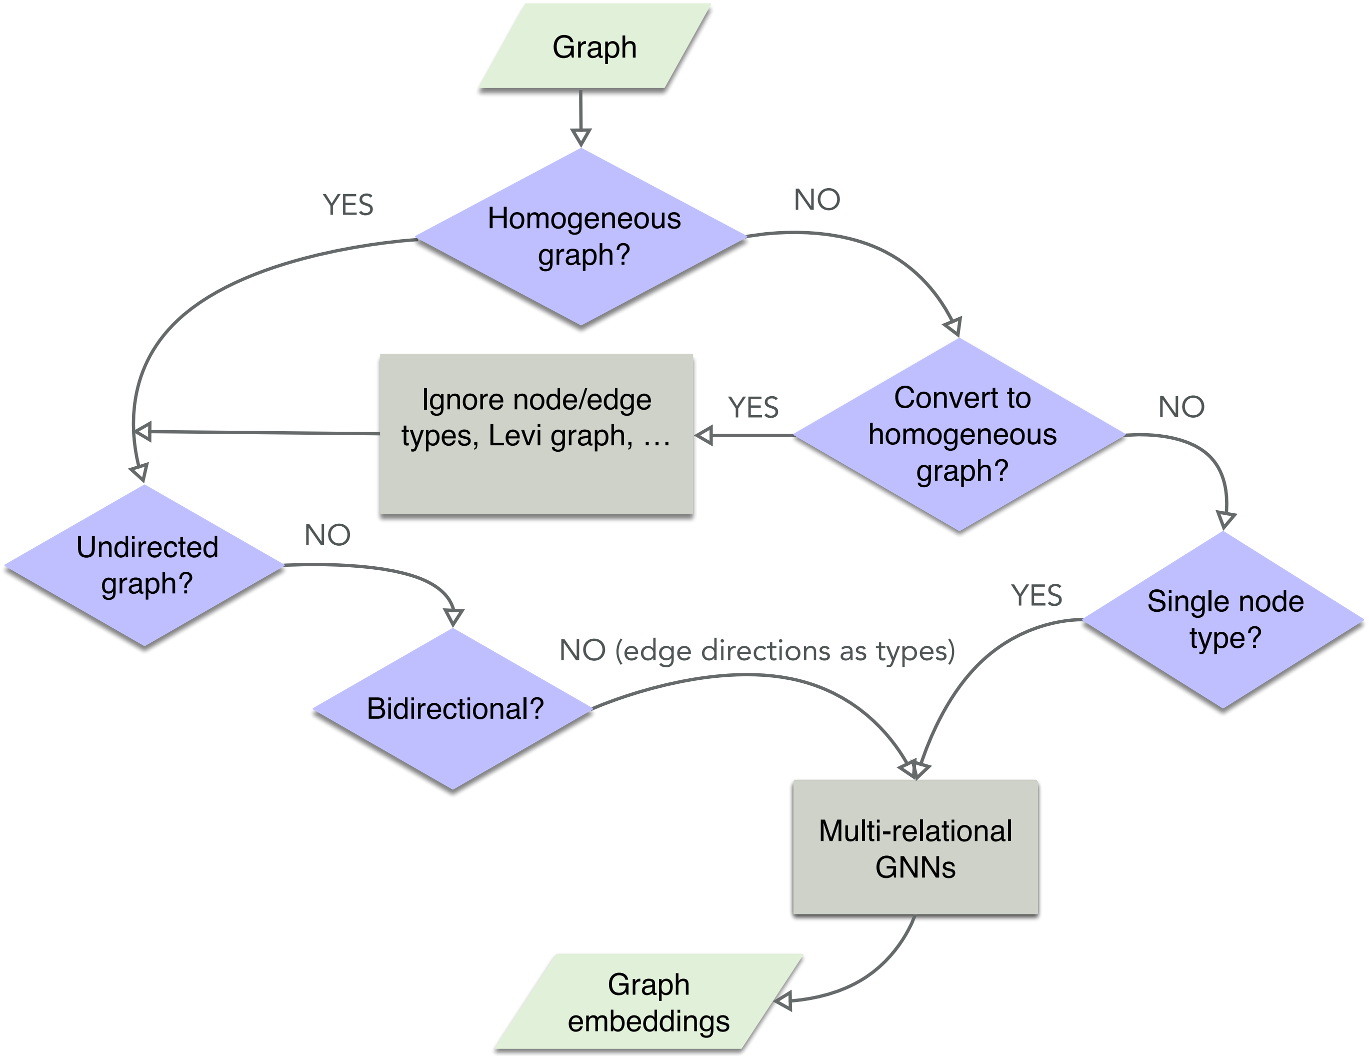
Update node embeddings with fused aggregation vectors at each hop

$$\mathbf{h}^k_i = \sigma(\mathbf{h}^{k-1}_i, \mathbf{h}^k_{\mathcal{N}(v_i)})$$

Chen et al. "Reinforcement Learning Based Graph-to-Sequence Model for Natural Question Generation". ICLR 2020.

Multi-relational GNNs for NLP

- When to use multi-relational GNNs?
- Multi-relational GNNs
  a) Including relation-specific transformation parameters in GNN
  b) Including edge embeddings in GNN
  c) Multi-relational Graph Transformers



R-GNN: Overview

$$\mathbf{h}_i^k = \sigma(\mathbf{h}_i^{k-1}, \sum_{v_j \in \mathcal{N}(v_i)} AGG(\mathbf{h}_j^{k-1}, \theta^k))$$

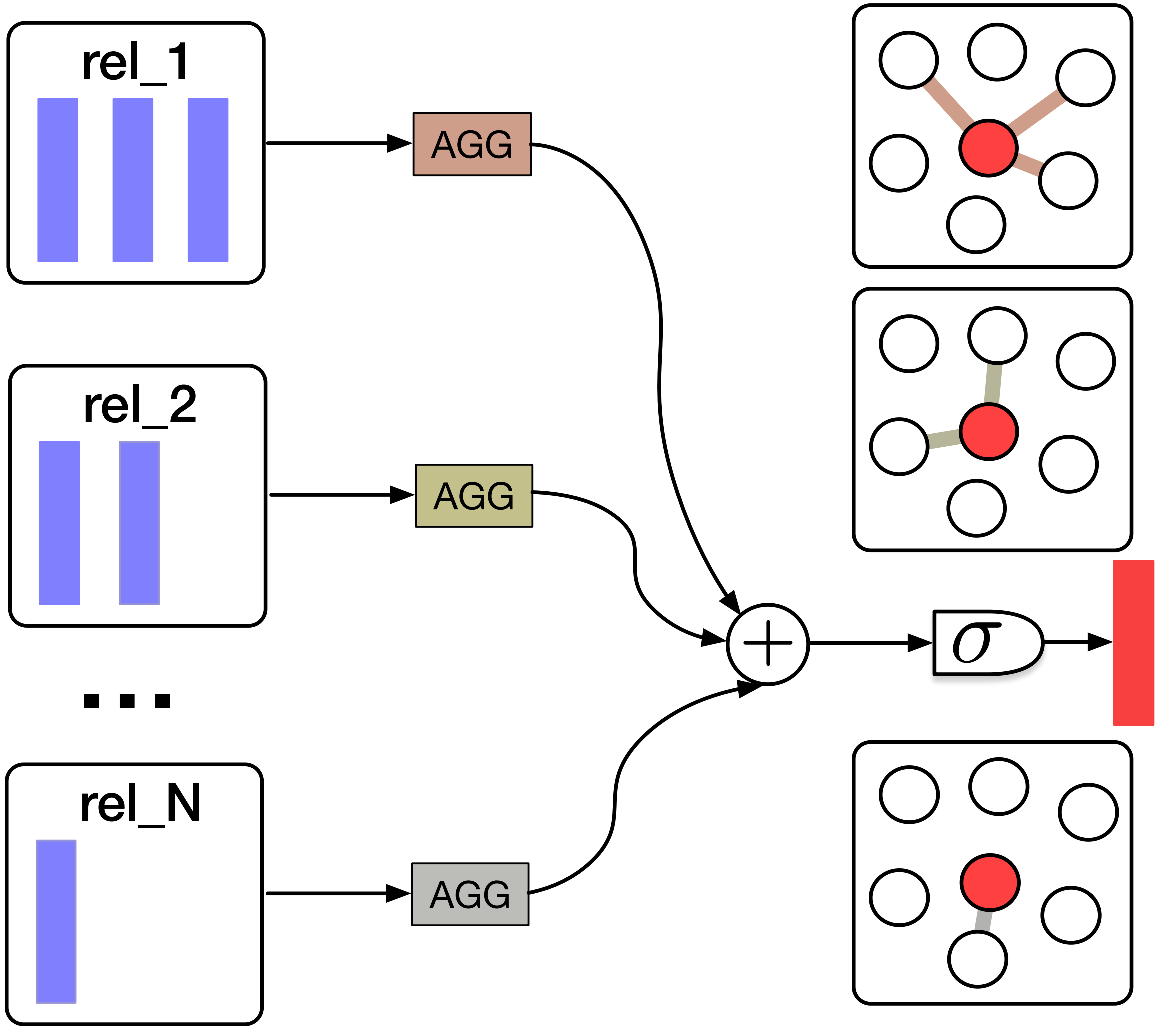
GNN

R-GNN

1) relation-specific transformation, e.g., node feature transformation, attention weight …

$$\mathbf{h}_i^k = \sigma(\mathbf{h}_i^{k-1}, \sum_{r \in \mathcal{E}} \sum_{v_j \in \mathcal{N}_r(v_i)} AGG(\mathbf{h}_j^{k-1}, \theta_r^k))$$

2) aggregation per relation-specific subgraph



R-GNN Variant: R-GCN

- Relation-specific node feature transformation during neighborhood aggregation

$$\mathbf{h}_i^k = \sigma\Big(\sum_{r\in\mathcal{E}}\sum_{v_j\in\mathcal{N}_r(v_i)}\frac{1}{c_{i,r}}\mathbf{W}_r^k\mathbf{h}_j^{k-1} + \mathbf{W}_0^k\mathbf{h}_i^{k-1}\Big), \quad c_{i,r} = |\mathcal{N}_r(v_i)|$$

Relation-specific d x d learnable weight matrix

Schlichtkrull et al. “Modeling Relational Data with Graph Convolutional Networks”. 2017.

R-GNN: Avoiding Over-parameterization

Learning d x d transformation weight matrix for each relation is expensive!

O(Rd^2) parameters every GNN layer where R is the num of relation types

How to avoid over-parameterization?

Option 1) basis decomposition - linear hypothesis

$$\theta_r^k = \sum_{b=1}^{B} a_{rb}^k \mathbf{V}_b^k, \quad \mathbf{V}_b^{(k)} \in \mathbb{R}^{d \times d}$$

O(RB + Bd^2) parameters

Basis matrices

Option 2) block-diagonal decomposition - sparsity hypothesis

$$\theta_r^k = \bigoplus_{b=1}^{B} \mathbf{Q}_{br}^k = diag(\mathbf{Q}_{1r}^k, \mathbf{Q}_{2r}^k, ..., \mathbf{Q}_{Br}^k), \quad \mathbf{Q}_{br}^{(k)} \in \mathbb{R}^{d/B \times d/B}$$

O(Rd^2/B) parameters

Submatrices

Including Edge Embeddings in GNNs

Variant 1) Include edge embeddings in message passing

$$\mathbf{h}_i^k = \sigma(\mathbf{h}_i^{k-1}, \sum_{v_j \in \mathcal{N}(v_i)} AGG(\mathbf{h}_j^{k-1}, \boxed{\mathbf{e}_{i,j}}, \theta^k))$$

Edge embeddings

Variant 2) Update edge embedding in message passing

$$\mathbf{h}_i^k = \sigma(\mathbf{h}_i^{k-1}, \sum_{v_j \in \mathcal{N}(v_i)} AGG(\mathbf{h}_j^{k-1}, \mathbf{e}_{i,j}^{k-1}, \theta^k)), \quad \boxed{\mathbf{e}_{i,j}^k = f(\mathbf{e}_{i,j}^{k-1}, \theta_{rel}^k)}$$

Update edge embeddings

Chen et al. "Toward Subgraph Guided Knowledge Graph Question Generation with Graph Neural Networks". 2020.

Vashishth et al. "Composition-based Multi-Relational Graph Convolutional Networks". ICLR 2020.

Multi-relational Graph Transformers

- Transformers as a special class of GNNs which
  - jointly learn and encode a fully-connected graph via self-attention
  - share many similarities with GAT
  - fail to effectively handle arbitrary graph-structured data
    - e.g., position embeddings for sequential data, removing position embeddings for set
- Multi-relational graph transformers
  - employed with structure-aware self-attention
  - respect various relation types

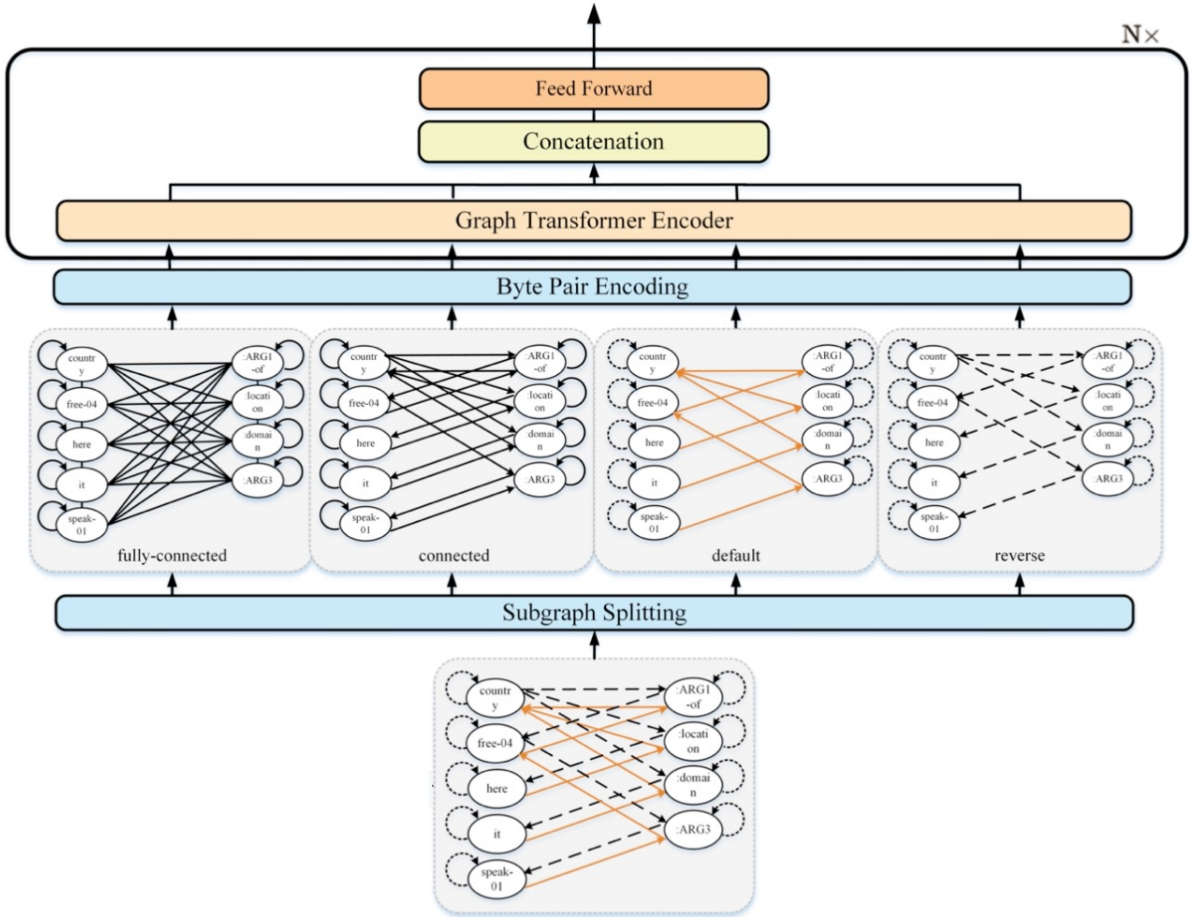
R-GAT based Graph Transformers

GAT-like masked attention

$$\mathbf{z}_i^{r,k} = \sum_{v_j \in \mathcal{N}_r(v_i)} \alpha_{i,j}^k \mathbf{W}_V^k \mathbf{h}_j^{k-1}, r \in \mathcal{E}$$

$$\mathbf{h}_i^k = \mathrm{FFN}^k(\mathbf{W}_O^k[\mathbf{z}_i^{R_1,k}, \ldots, \mathbf{z}_i^{R_m,k}])$$

Relation-specific learnable weight matrix



Yao et al. *"Heterogeneous Graph Transformer for Graph-to-Sequence Learning". ACL 2020.*

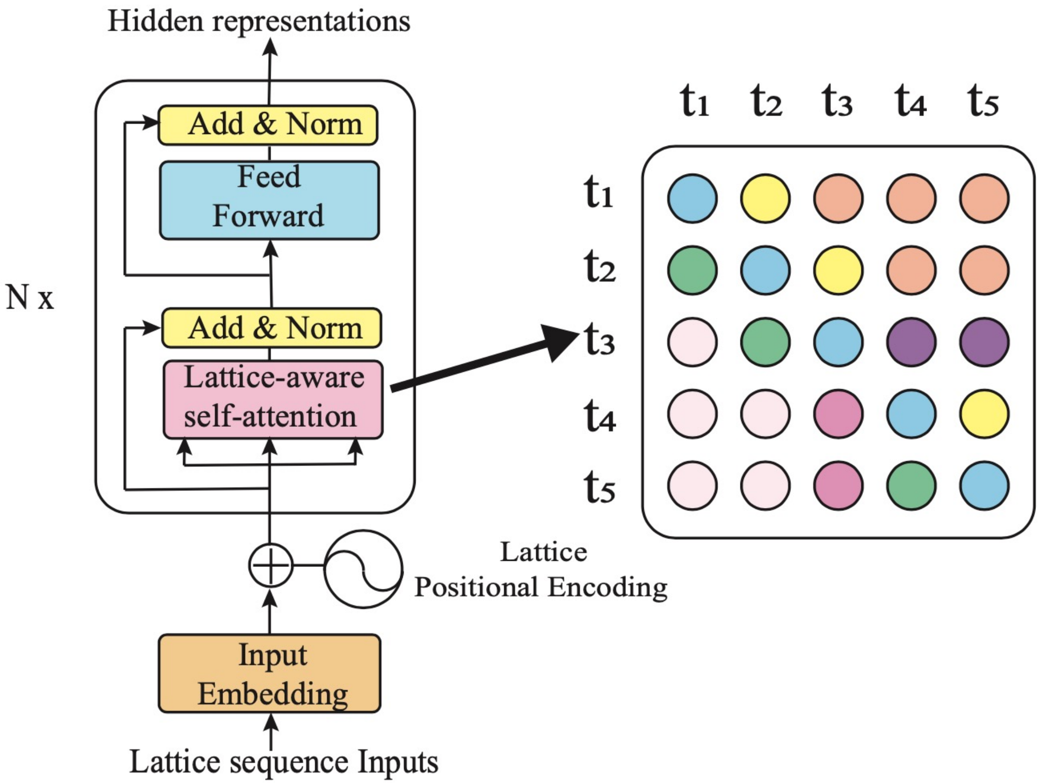
Structure-aware Self-attention based Graph Transformers

$$\mathbf{h}_i^k = \sum_j \alpha_{i,j}^k (\mathbf{W}_V^k \mathbf{h}_j^{k-1} + \mathbf{W}_F^k \mathbf{e}_{i,j})$$

$$\alpha_{i,j}^k = softmax(u_{i,j}^k)$$

$$u_{i,j}^k = \frac{(\mathbf{W}_Q^k \mathbf{h}_i^{k-1})^T (\mathbf{W}_K^k \mathbf{h}_j^{k-1} + \mathbf{W}_R^k \mathbf{e}_{i,j})}{\sqrt{d}}$$

Edge embeddings

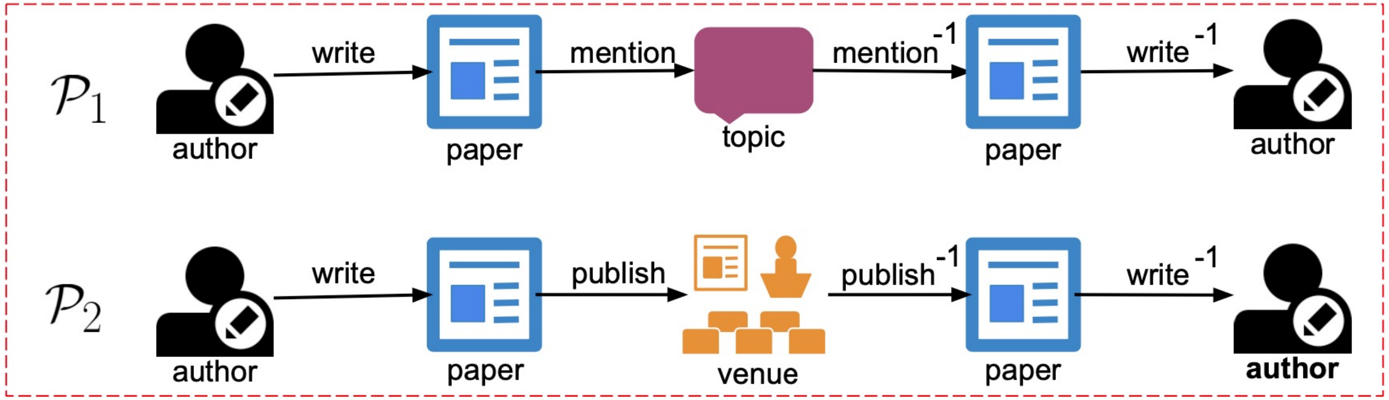


Xiao et al. "Lattice-Based Transformer Encoder for Neural Machine Translation". ACL 2019.

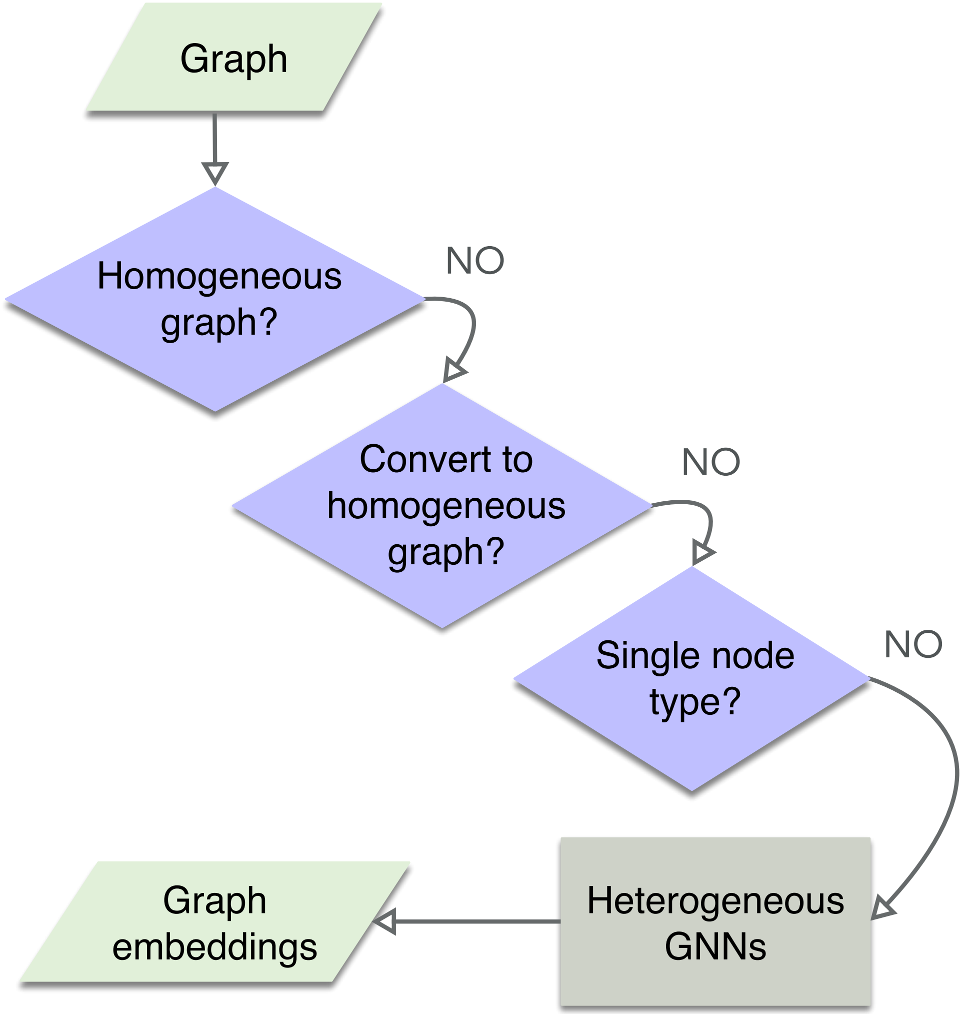
Zhu et al. "Modeling Graph Structure in Transformer for Better AMR-to-Text Generation". EMNLP 2019.

Heterogeneous GNNs

- When to use Heterogeneous GNNs?
- Heterogeneous GNNs
  a) Meta-path based Heterogeneous GNNs



Meta paths among author nodes



Meta-path based Heterogeneous GNN example: HAN

Step 1) type-specific node feature transformation

$$\mathbf{h}_i = \mathbf{W}_{\tau(v_i)} \mathbf{v}_i$$

Node-type specific learnable weight matrix

Step 2) node-level aggregation along each meta path

$$\mathbf{z}_{i,\Phi_k} = \sigma\Big(\sum_{v_j \in \mathcal{N}_{\Phi_k}(v_i)} \alpha_{i,j}^{\Phi_k} \mathbf{h}_j \Big)$$

Aggregate over neighboring nodes in k-length meta path

Step 3) meta-path level aggregation

$$\mathbf{z}_i = \sum_{k=1}^{p} \beta_{\Phi_k} \mathbf{z}_{i,\Phi_k}$$

Attention weights over meta paths

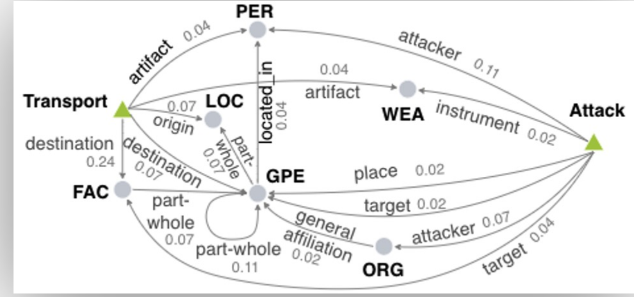
Wang et al. “Heterogeneous Graph Neural Networks for Extractive Document Summarization”. ACL 2020.

Graph Encoder-Decoder Models for NLP

Seq2Seq: Applications and Challenges

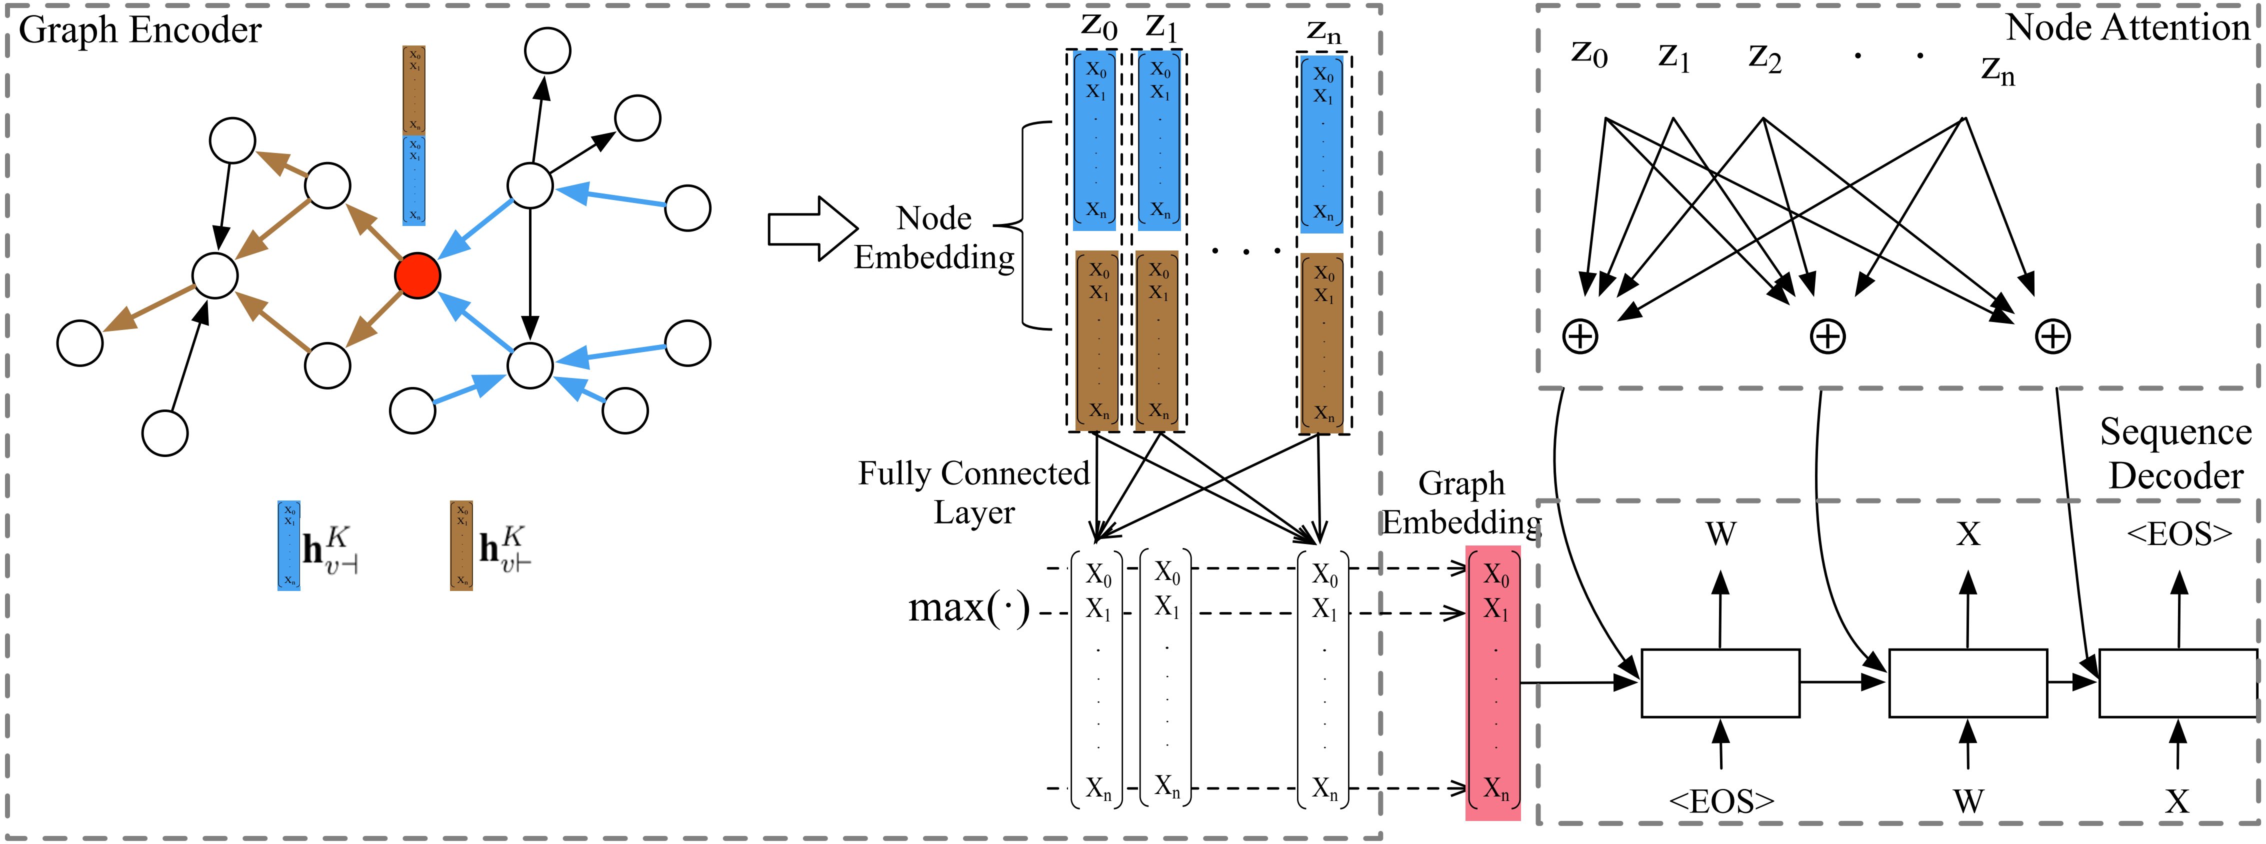
- Applications
  - Machine translation
  - Natural language generation
  - Logic form translation
  - Information extraction

Global Natural Language Generation Market accounted for USD 279.5 million in 2017 and is projected to grow at a CAGR of 21.1% during the forecast period of 2018 to 2025



- Challenges
  - Only applied to problems whose inputs are represented as sequences
  - Cannot handle more complex structure such as graphs
  - Converting graph inputs into sequences inputs lose information
  - Augmenting original sequence inputs with additional structural information enhances word sequence feature

Graph-to-Sequence Model



[1] Kun Xu*, Lingfei Wu*, Zhiguo Wang, Yansong Feng, Michael Witbrock, and Vadim Sheinin (Equally Contributed), "Graph2Seq: Graph to Sequence Learning with Attention-based Neural Networks", arXiv 2018.

[2] Yu Chen, Lingfei Wu** and Mohammed J. Zaki (**Corresponding Author), "Reinforcement Learning Based Graph-to-Sequence Model for Natural Question Generation", ICLR'20.

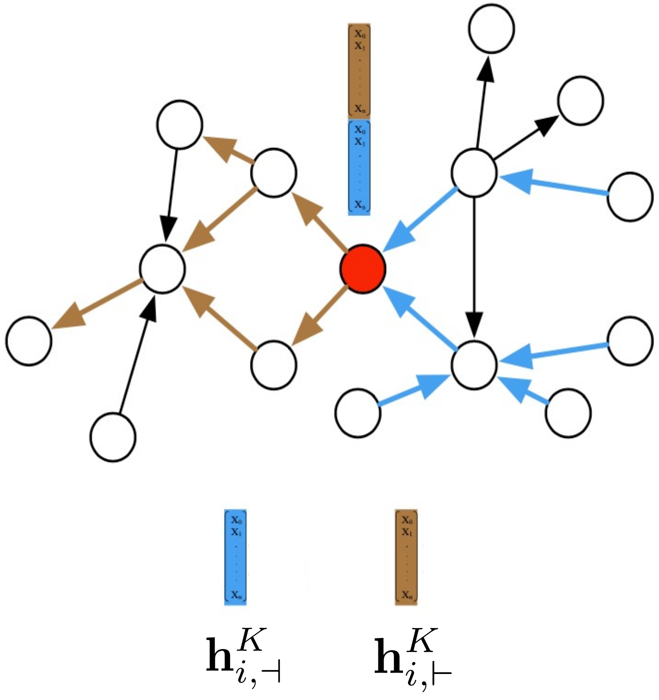
Bidirectional GNNs for Directed Graphs

Bi-Sep GNNs formulation:

Run multi-hop backward/forward GNN on the graph

$$\mathbf{h}^k_{i,\dashv} = GNN(\mathbf{h}^{k-1}_{i,\dashv}, \{\mathbf{h}^{k-1}_{j,\dashv} : \forall v_j \in \mathcal{N}_{\dashv}(v_i)\})$$

$$\mathbf{h}^k_{i,\vdash} = GNN(\mathbf{h}^{k-1}_{i,\vdash}, \{\mathbf{h}^{k-1}_{j,\vdash} : \forall v_j \in \mathcal{N}_{\vdash}(v_i)\})$$



Concatenate backward/forward node embeddings at last hop

$$\mathbf{h}^K_i = \mathbf{h}^K_{i,\dashv} || \mathbf{h}^K_{i,\vdash}$$

Xu et al. “Graph2Seq: Graph to Sequence Learning with Attention-based Neural Networks”. 2018.

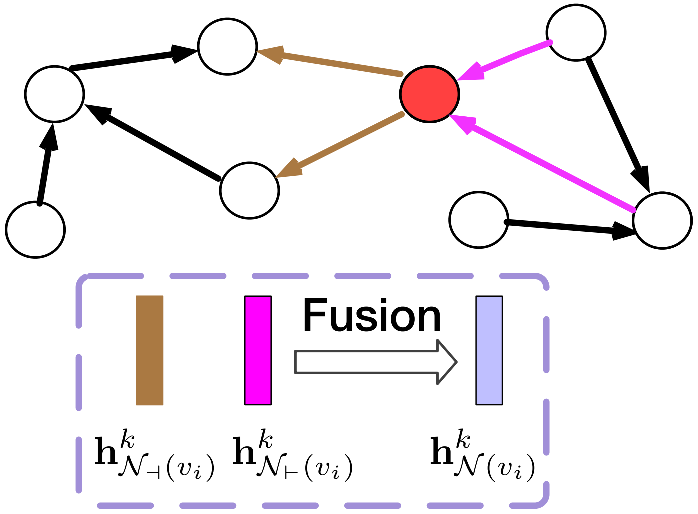
Bidirectional GNNs for Directed Graphs (cont)

Bi-Fuse GNNs formulation:

Run one-hop backward/forward node aggregation

$$\mathbf{h}^{k}_{\mathcal{N}_{\dashv}(v_i)} = AGG(\mathbf{h}^{k-1}_{i}, \{\mathbf{h}^{k-1}_{j} : \forall v_j \in \mathcal{N}_{\dashv}(v_i)\})$$

$$\mathbf{h}^{k}_{\mathcal{N}_{\vdash}(v_i)} = AGG(\mathbf{h}^{k-1}_{i}, \{\mathbf{h}^{k-1}_{j} : \forall v_j \in \mathcal{N}_{\vdash}(v_i)\})$$



Fusion
$\mathbf{h}^{k}_{\mathcal{N}_{\dashv}(v_i)}$
$\mathbf{h}^{k}_{\mathcal{N}_{\vdash}(v_i)}$
$\mathbf{h}^{k}_{\mathcal{N}(v_i)}$

Fuse backward/forward aggregation vectors at each hop

$$\mathbf{h}^{k}_{\mathcal{N}(v_i)} = Fuse(\mathbf{h}^{k}_{\mathcal{N}_{\dashv}(v_i)}, \mathbf{h}^{k}_{\mathcal{N}_{\vdash}(v_i)})$$

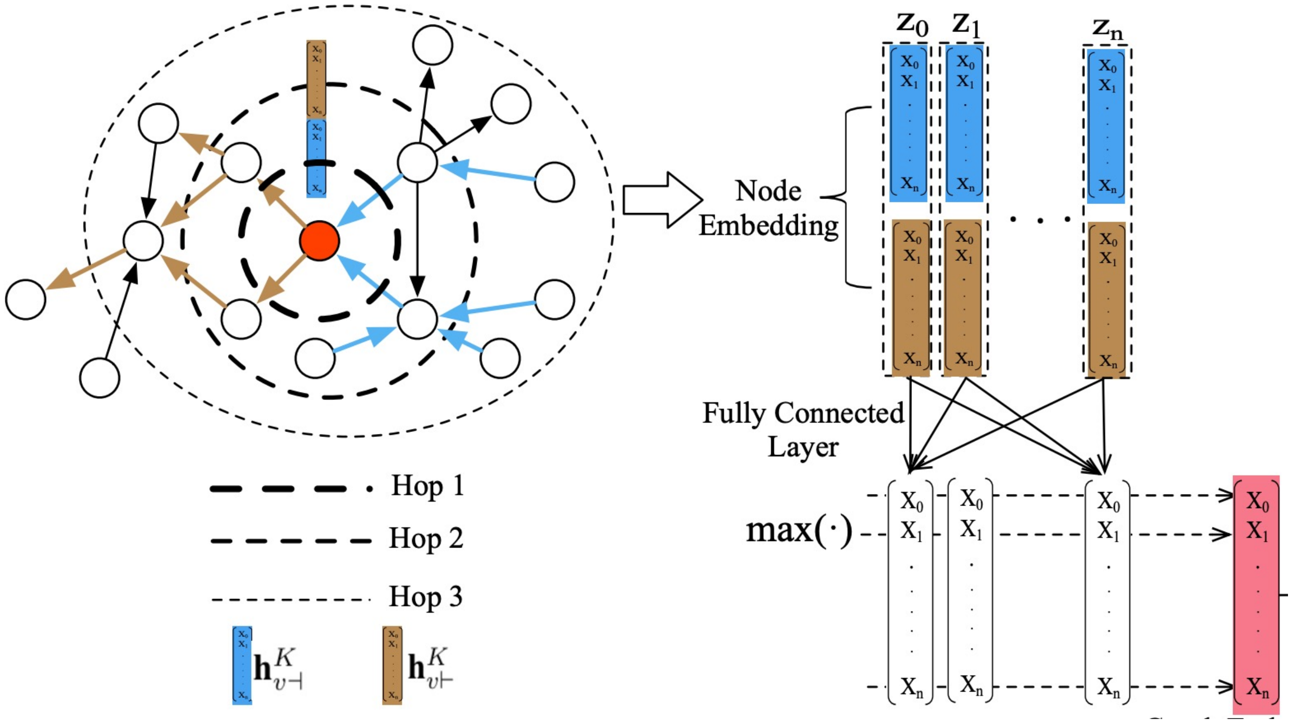
Update node embeddings with fused aggregation vectors at each hop

$$\mathbf{h}^{k}_{i} = \sigma(\mathbf{h}^{k-1}_{i}, \mathbf{h}^{k}_{\mathcal{N}(v_i)})$$

Chen et al. “Reinforcement Learning Based Graph-to-Sequence Model for Natural Question Generation”. ICLR 2020.

Graph Encoding

- Graph embedding
  - Pooling based graph embedding (*max, min and average pooling*)
  - Node based graph embedding
    - □ Add one super node which is connected to all other nodes in the graph
    - □ The embedding of this super node is treated as graph embedding



Attention Based Sequence Decoding

$$c_i = \sum_{j=1}^{\mathcal{V}} \alpha_{ij} h_j, \ \textit{where} \ \alpha_{ij} = \frac{\exp(e_{ij})}{\sum_{k=1}^{\mathcal{V}} \exp(e_{ik})}, \ e_{ij} = a(s_{i-1}, h_j)$$

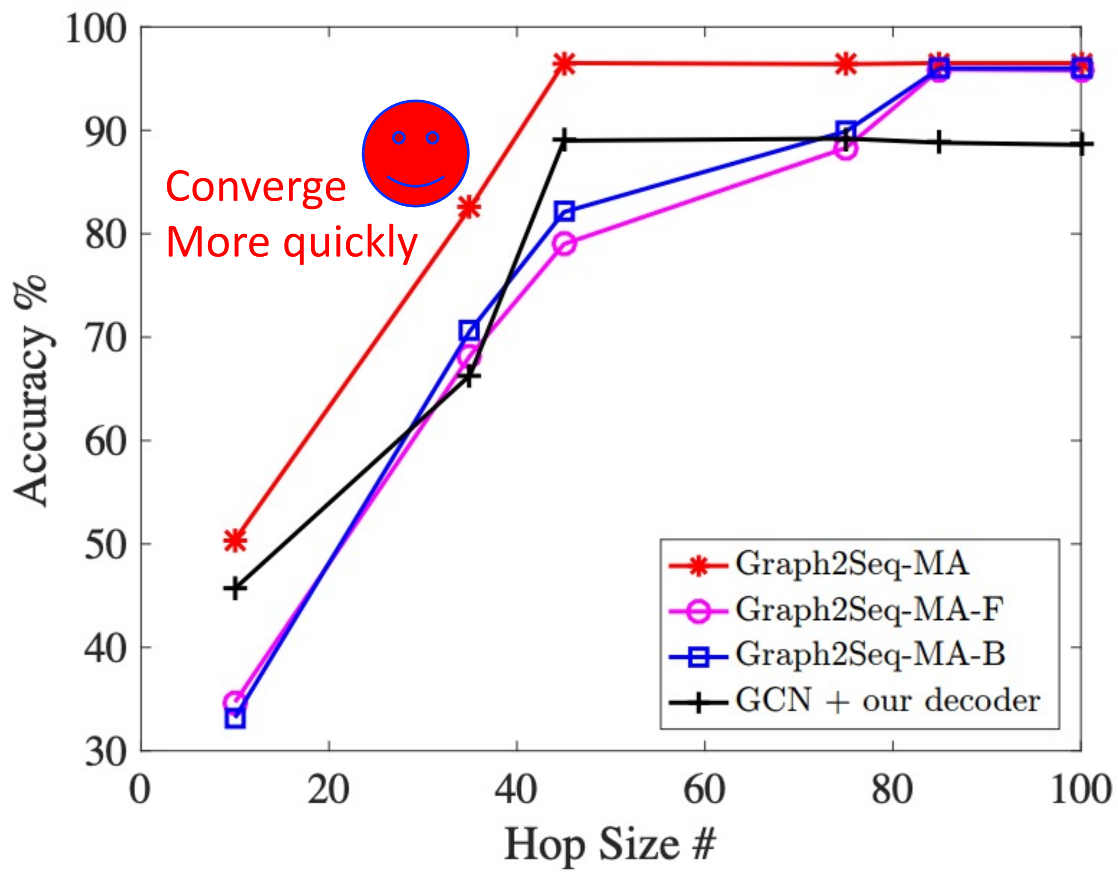
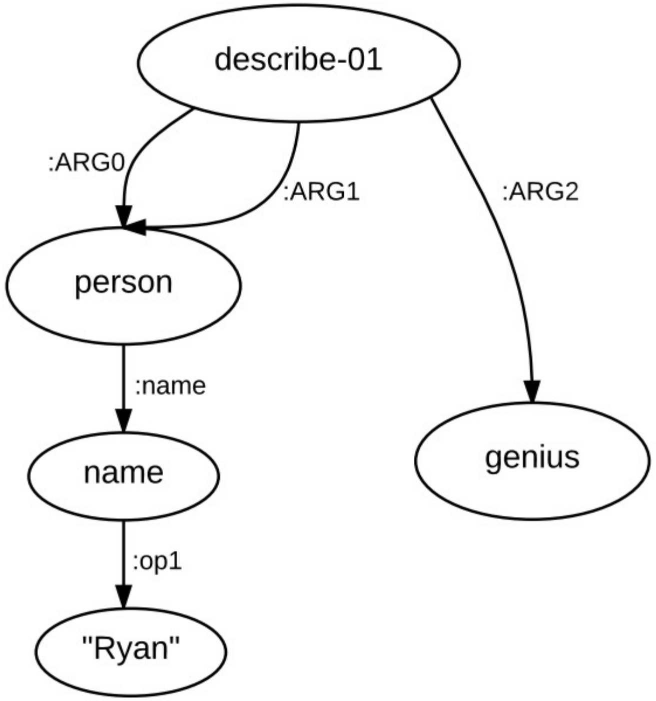
Effect of Bidirectional Node Embedding



Bidirectional Node Embedding
VS Unidirectional Node Embedding

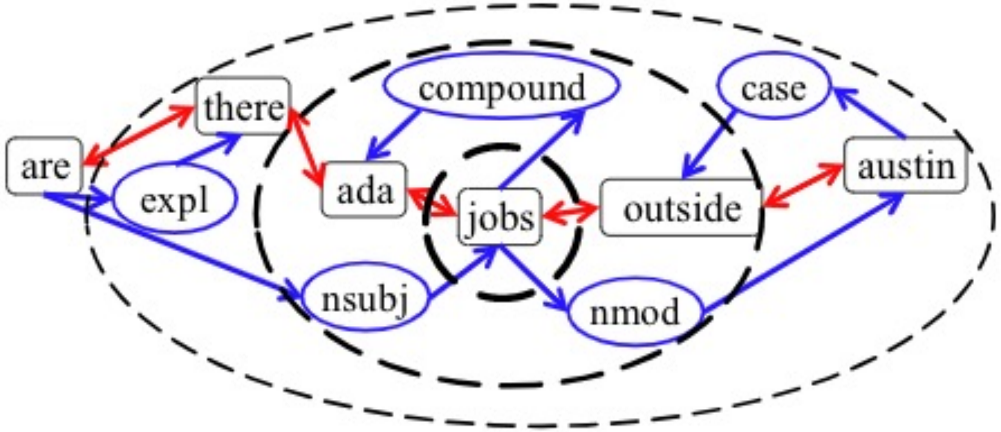
When Shall We Use Graph2Seq?

- Case I: the inputs are naturally or best represented in graph



"Ryan's description of himself: a genius."

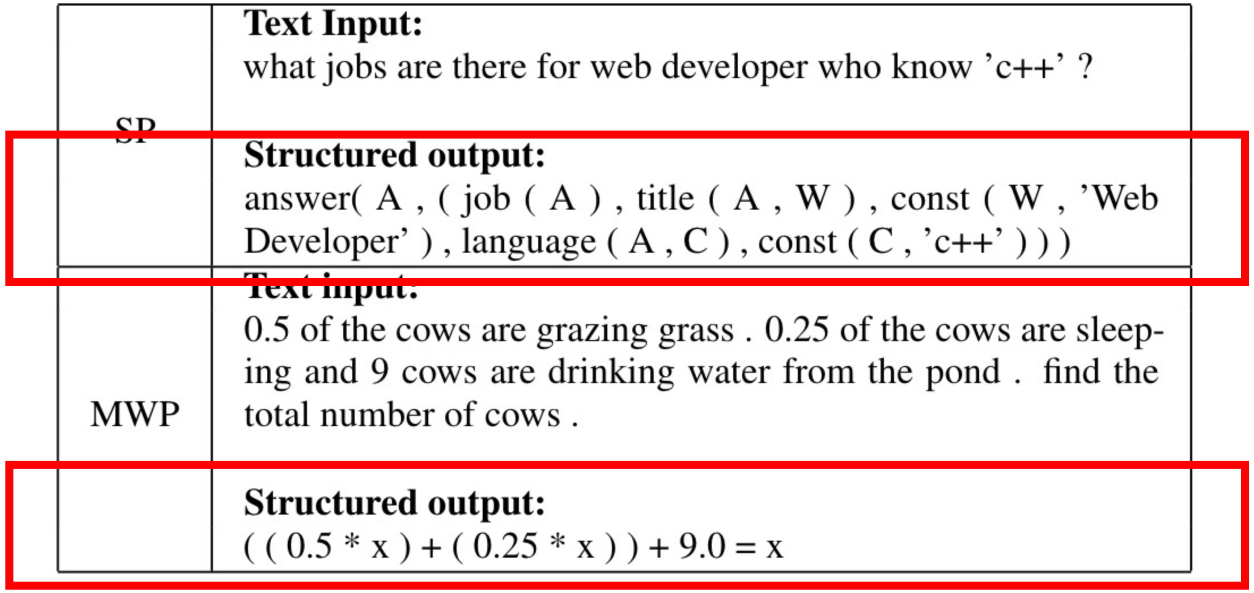
- Case II: Hybrid Graph with sequence and its hidden structural information



Augmenting "are there ada jobs outside Austin" with its dependency parsing tree results

Learning Structured Input-Output Translation

- To bridge the semantic gap between the human-readable words and machine-understandable logics.
- Semantic parsing is important for question answering, text understanding
- Automatically solving of MWP is a growing interest.



SP	**Text Input:** what jobs are there for web developer who know 'c++' ? **Structured output:** answer(A , (job (A) , title (A , W) , const (W , 'Web Developer') , language (A , C) , const (C , 'c++')))
MWP	**Text input:** 0.5 of the cows are grazing grass . 0.25 of the cows are sleeping and 9 cows are drinking water from the pond . find the total number of cows . **Structured output:** ((0.5 * x) + (0.25 * x)) + 9.0 = x

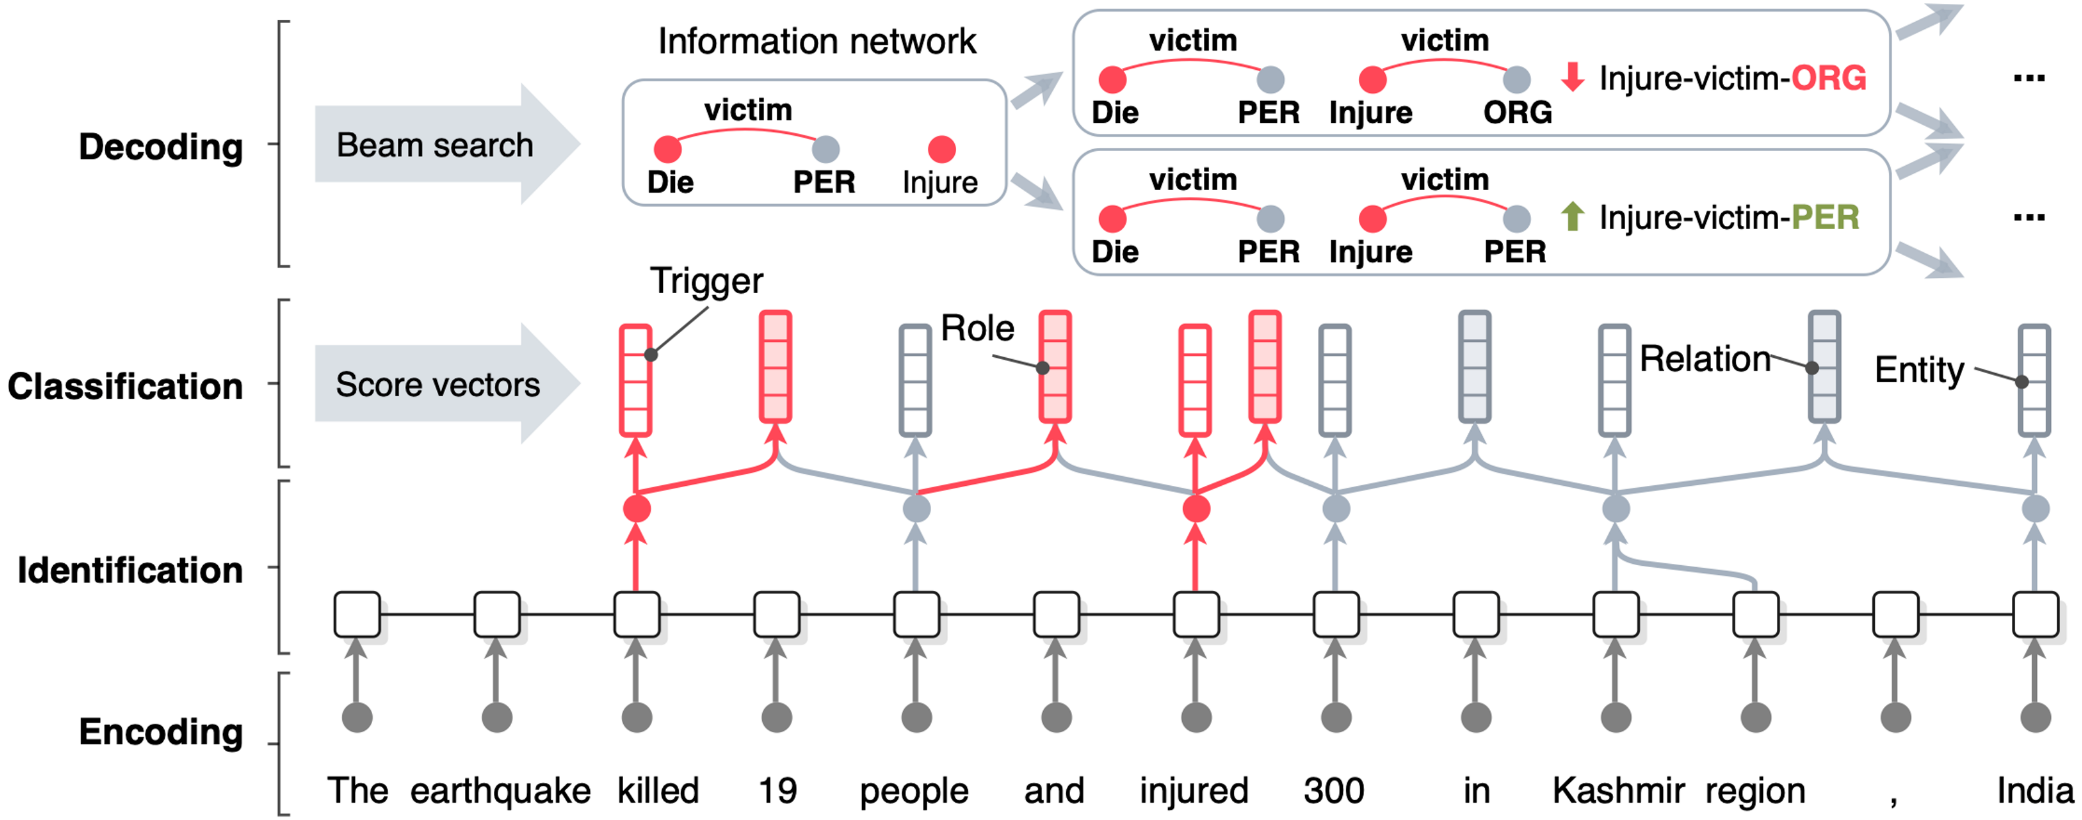
DLG4NLP Applications

Information Extraction

Outline

- ➢ Semantic Graph Parsing for Event Extraction
- Cross-lingual structure transfer for Relation Extraction and Event Extraction
- Cross-media Structured Common Space for Multimedia Event Extraction
- Graph Schema-guided Event Extraction and Prediction
- Cross-media Knowledge Graph based Misinformation Detection

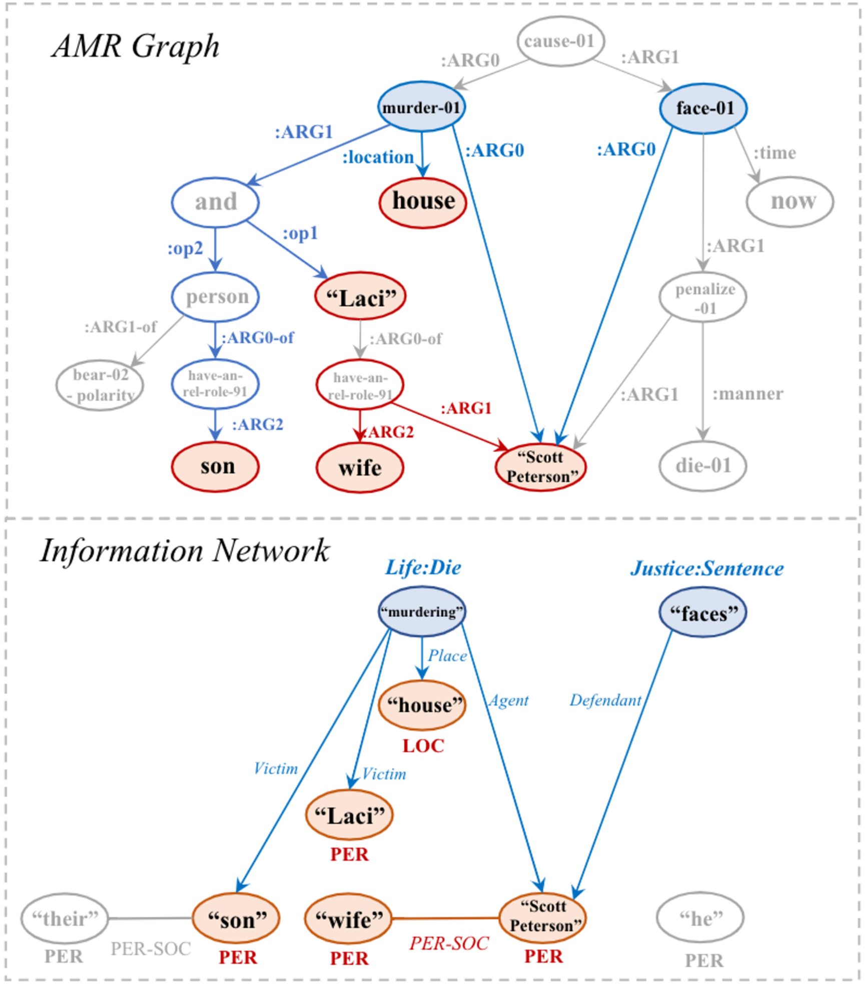
Information Extraction: a Sequence-to-Graph Task



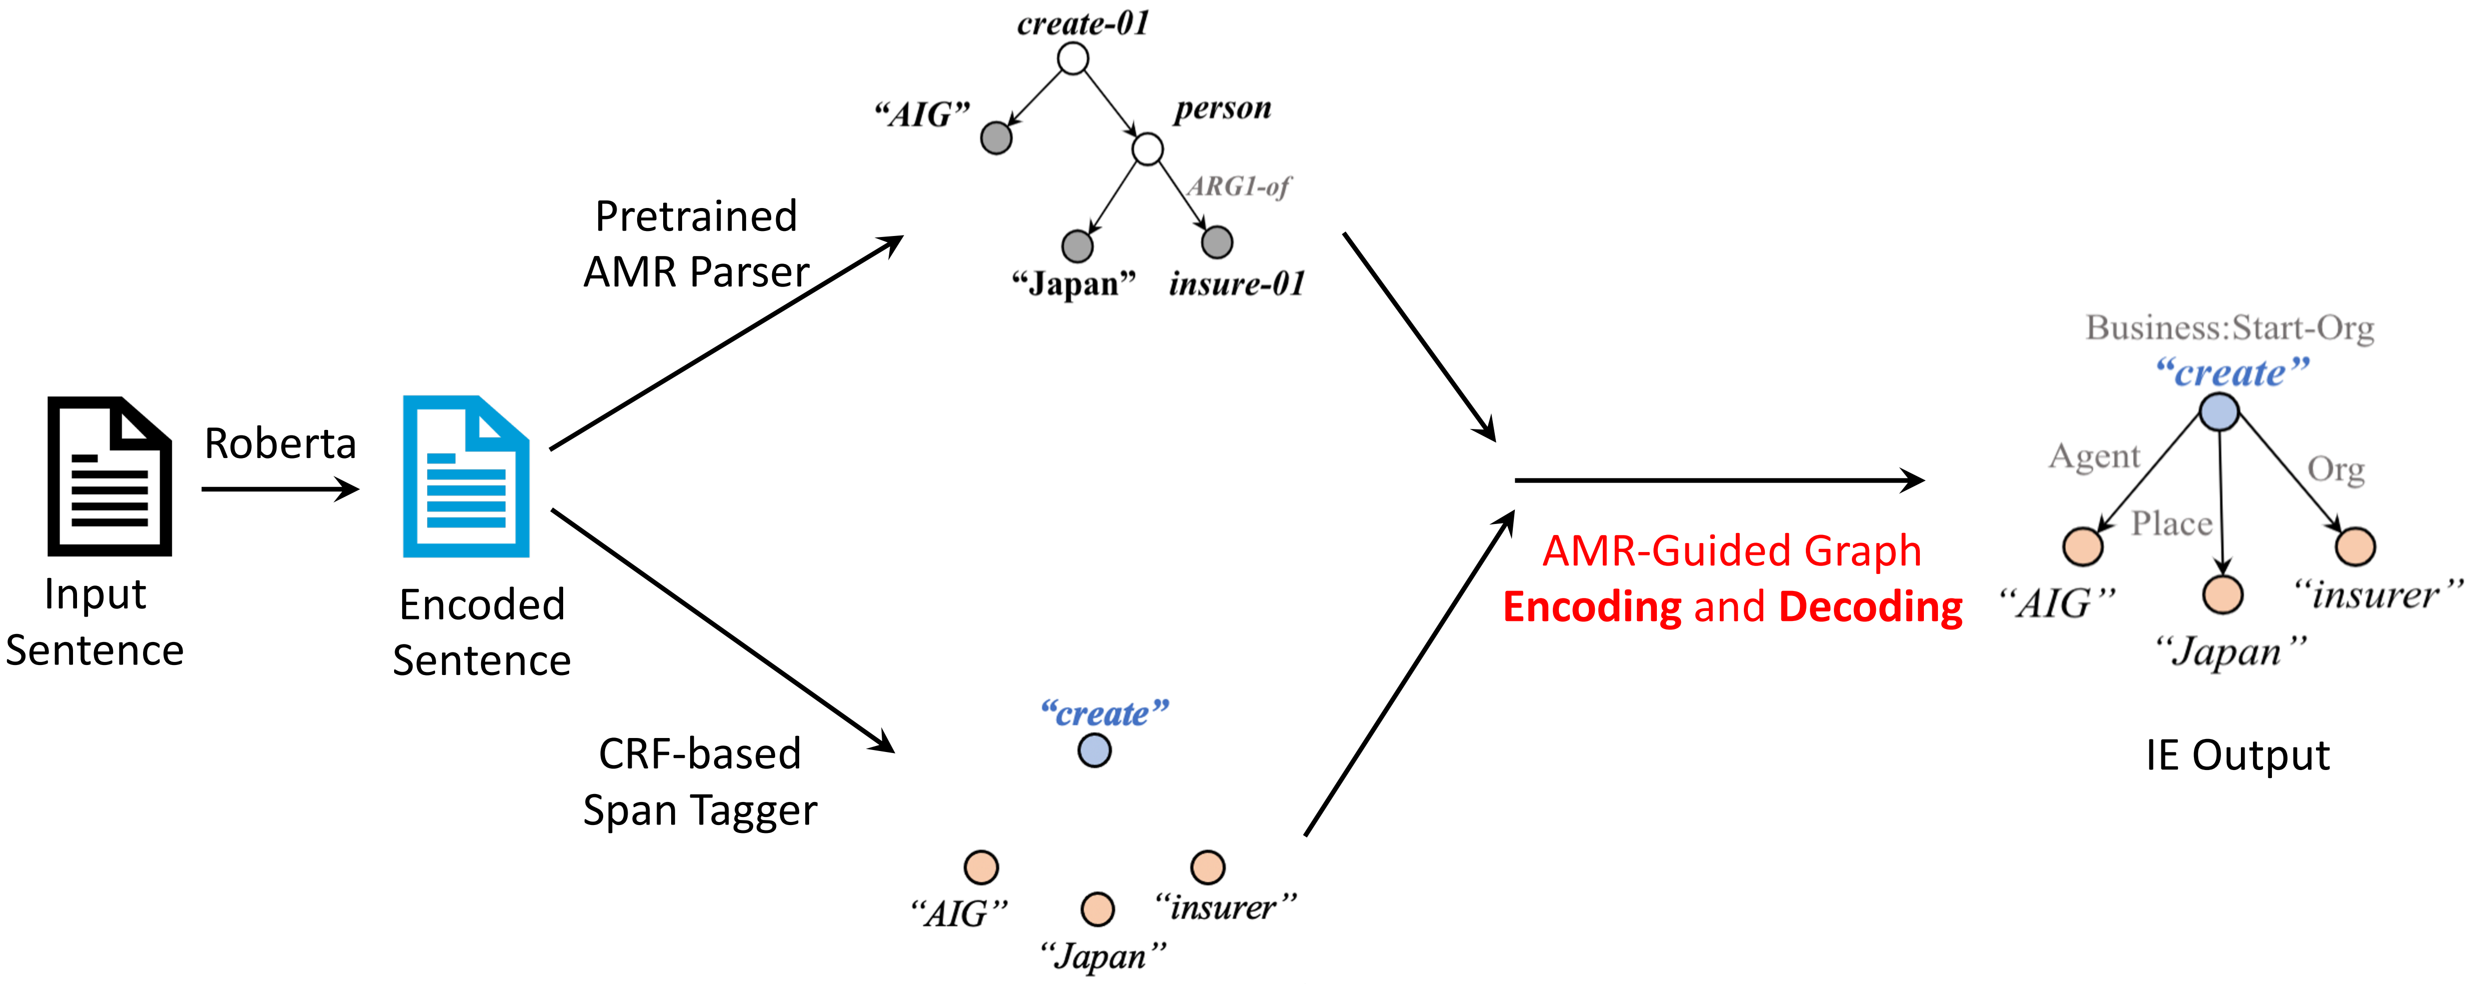
- OneIE [Lin et al., ACL2020] framework extracts the information graph from a given sentence in four steps: encoding, identification, classification, and decoding

Moving from Seq-to-Graph to Graph-to-Graph

- [Zhang and Ji, NAACL2021]
- Abstract Meaning Representation (AMR):
  - A kind of rich semantic parsing
  - Converts input sentence into a directed and acyclic graph structure with fine-grained node and edge type labels
- AMR parsing shares inherent similarities with information network (IE output)
  - Similar node and edge semantics
  - Similar graph topology
- Semantic graphs can better capture non-local context in a sentence
- Exploit the similarity between AMR and IE to help on joint information extraction



AMR-IE: An AMR-guided encoding and decoding framework for IE



Input Sentence

Roberta

Encoded Sentence

Pretrained AMR Parser

CRF-based Span Tagger

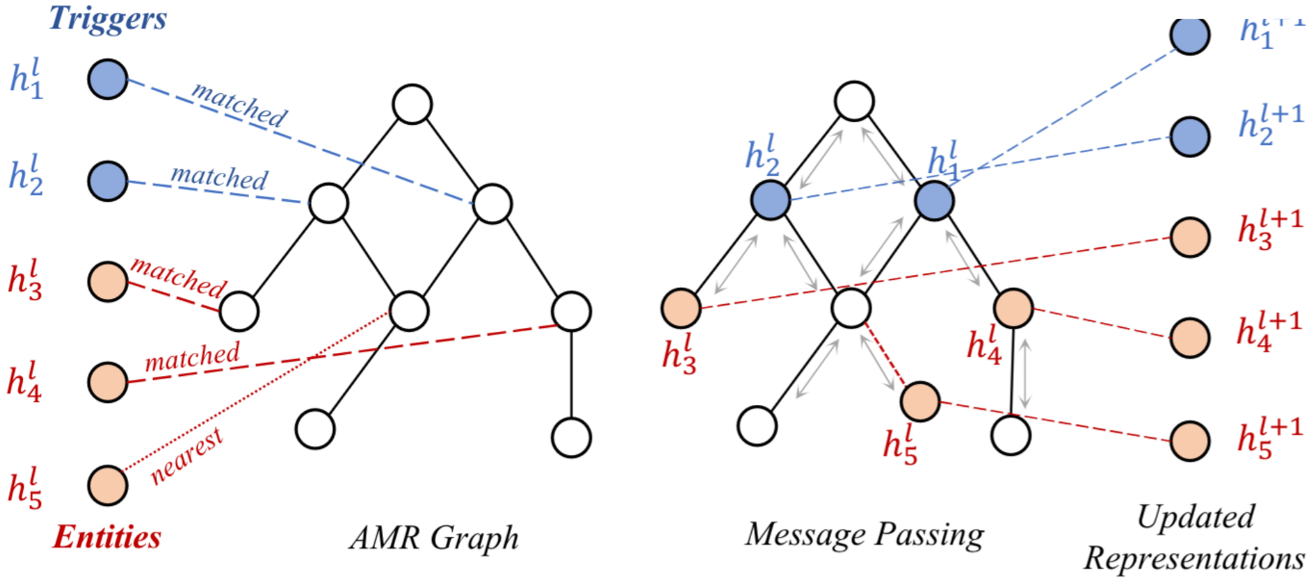
AMR-Guided Graph **Encoding** and **Decoding**

IE Output

AMR Guided Graph Encoding: Using an Edge-Conditioned GAT

- Map each candidate entity and event to AMR nodes.
- Update entity and event representations using an edge-conditioned GAT to incorporate information from AMR neighbors.

$$\alpha_{i,j}^{l} = \frac{\exp\left(\sigma\left(f^{l}[\mathbf{W}\boldsymbol{h}_i^l : \mathbf{W}_e\boldsymbol{e}_{i,j} : \mathbf{W}\boldsymbol{h}_j^l]\right)\right)}{\sum_{k\in\mathcal{N}_i}\exp\left(\sigma\left(f^{l}[\mathbf{W}\boldsymbol{h}_i^l : \mathbf{W}_e\boldsymbol{e}_{i,k} : \mathbf{W}\boldsymbol{h}_k^l]\right)\right)}$$



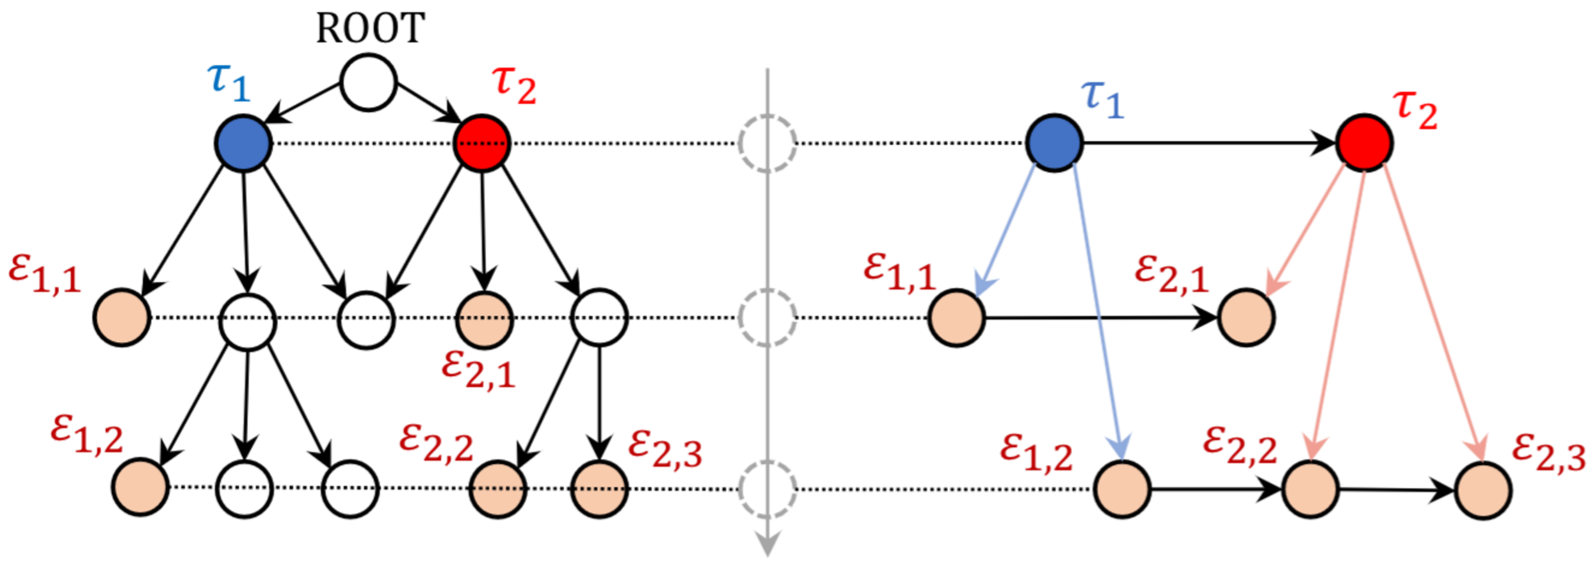
$$\boldsymbol{h}^* = \sum_{j\in\mathcal{N}_i}\alpha_{i,j}^l\boldsymbol{h}_i^l$$

$$\boldsymbol{h}^{l+1} = \boldsymbol{h}^l + \gamma\cdot\mathbf{W}^*\boldsymbol{h}^*$$

AMR Guided Graph Decoding: Ordered decoding guided by AMR

- Beam search based decoding as in *OneIE* (Lin et al. 2020).
- The decoding order of candidate nodes are determined by the hierarchy in AMR in a **top-to-down manner**.
- For example, the correct ordered decoding in the following graph is:

$$\tau_1,\ \tau_2,\ \varepsilon_{1,1},\ \varepsilon_{2,1},\ \varepsilon_{1,2},\ \varepsilon_{2,2},\ \varepsilon_{2,3}$$



Examples on how AMR graphs help

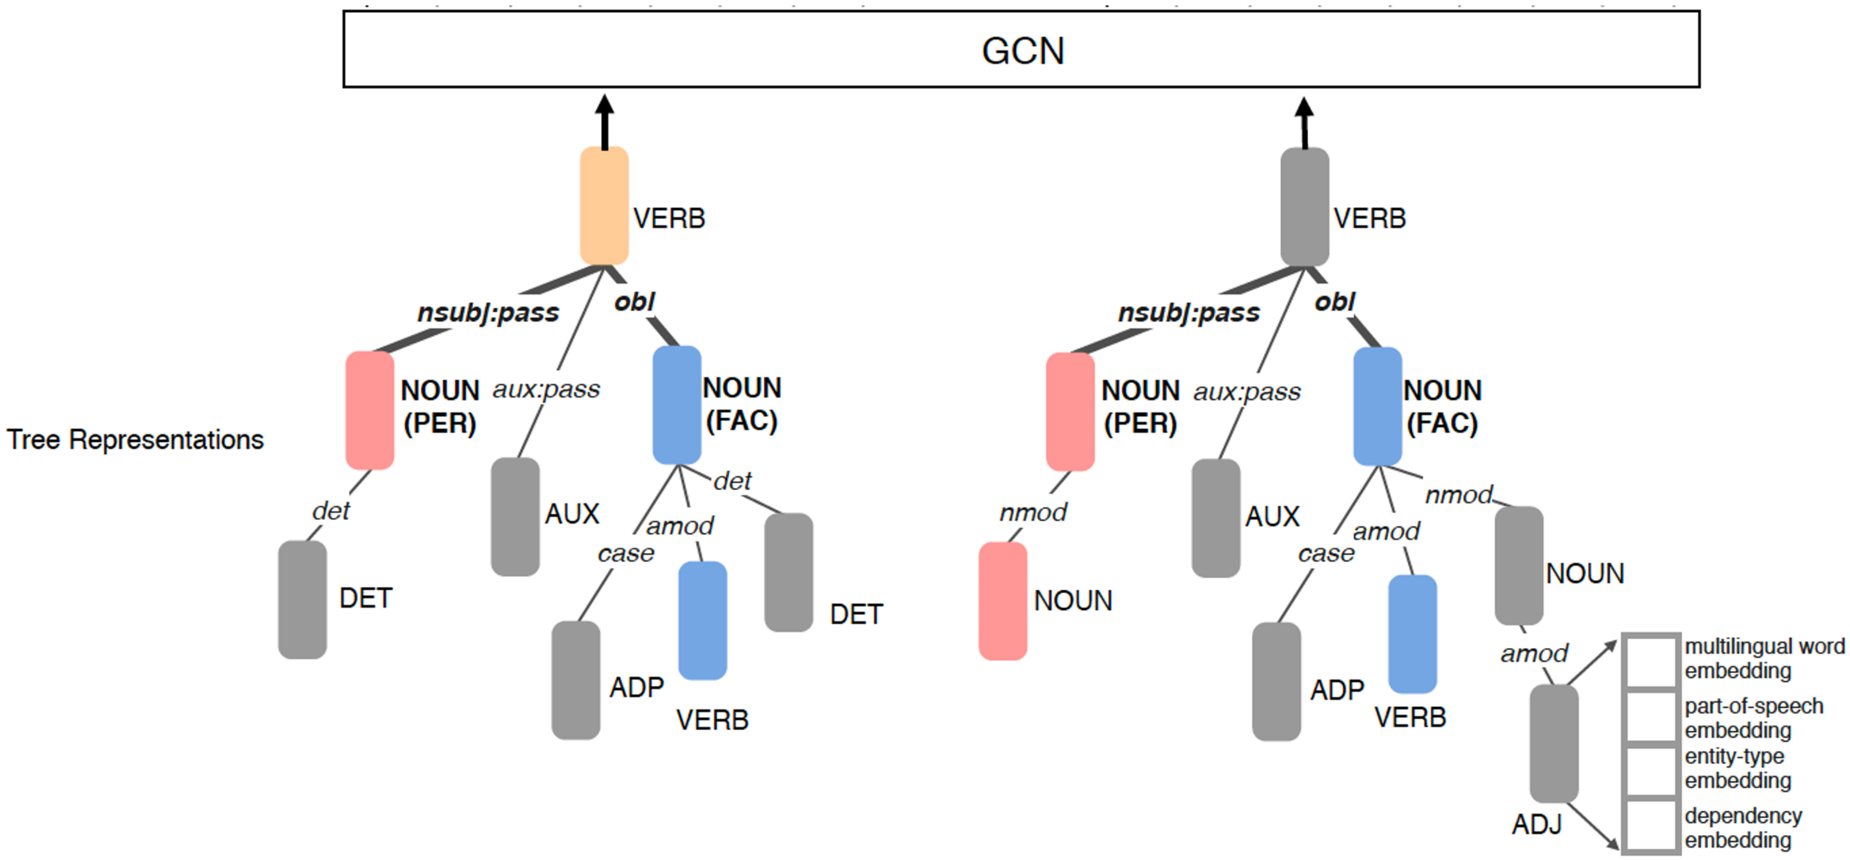
Outline

- Semantic Graph Parsing for Event Extraction

➢ Cross-lingual structure transfer for Relation Extraction and Event Extraction

- Cross-media Structured Common Space for Multimedia Event Extraction
- Graph Schema-guided Event Extraction and Prediction
- Cross-media Knowledge Graph based Misinformation Detection

Cross-lingual Structure Transfer



The detainees were taken to a processing center

Команды врачей были замечены в упакованных отделениях скорой помощи (teams of doctors were seen in packed emergency rooms)

Graph Convolutional Networks (GCN) Encoder

- Extend the monolingual design (Zhang et al., 2018) to cross-lingual
- Convert a sentence with N tokens into N*N adjacency matrix *A*
- Node: token, each edge is a directed dependency edge
- Initialization of each node's representation

$$\boldsymbol{h}_i^{(0)} = \boldsymbol{x}_i^w \oplus \boldsymbol{x}_i^p \oplus \boldsymbol{x}_i^d \oplus \boldsymbol{x}_i^e$$

Word embedding   POS tag   Dependency relation   Entity type

- At the kth layer, derive the hidden representation of each node from the representations of its neighbors at previous layer

$$\boldsymbol{h}_i^{(k)} = \mathrm{ReLU}\left(\sum_{j=0}^{N} \frac{\boldsymbol{A}_{ij} \boldsymbol{W}^{(k)} \boldsymbol{h}_j^{(k-1)}}{d_i + b^{(k)}} \right)$$

Application on Event Argument Extraction

- Task: Classify each pair of event trigger and entity mentions into one of pre-defined event argument roles or NONE
- Max-pooling over the final node representations to obtain representations for sentence, trigger and argument candidate, and concatenate them
- A softmax output layer for argument role labeling

$$L^a = \sum_{i=1}^{N} \sum_{j=1}^{L_i} y_{ij} \log(\sigma(\boldsymbol{U}^a \cdot [\boldsymbol{h}_i^t; \boldsymbol{h}_{ij}^s; \boldsymbol{h}_j^a]))$$

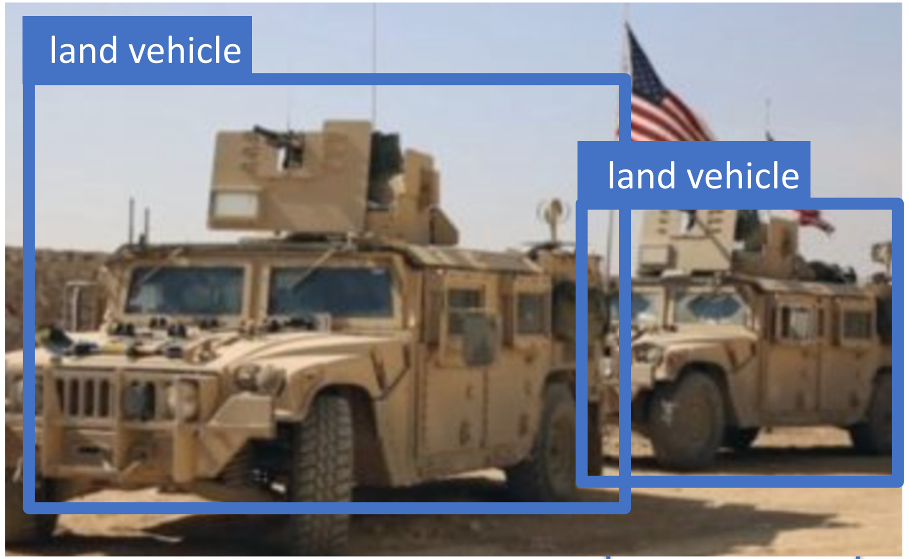
Multimedia Event Extraction (M^2E^2)

[Li et al., ACL2020]

Last week , U.S . Secretary of State Rex Tillerson visited Ankara, the first senior administration official to visit Turkey, to try to seal a deal about the battle for Raqqa and to overcome President Recep Tayyip Erdogan's strong objections to Washington's backing of the Kurdish Democratic Union Party (PYD) militias. Turkish forces have attacked SDF forces in the past around Manbij, west of Raqqa, forcing the **United States** to **deploy** dozens of **soldiers** on the **outskirts** of the town in a mission to prevent a repeat of clashes, which risk derailing an assault on Raqqa.



Output: Multimedia Events & Argument Roles

Event Type	Movement.Transport	
Event	**Text Trigger**	deploy
	Image	

Arguments	**Agent**	United States
	Destination	outskirts
	Artifact	soldiers
	Vehicle	
	Vehicle

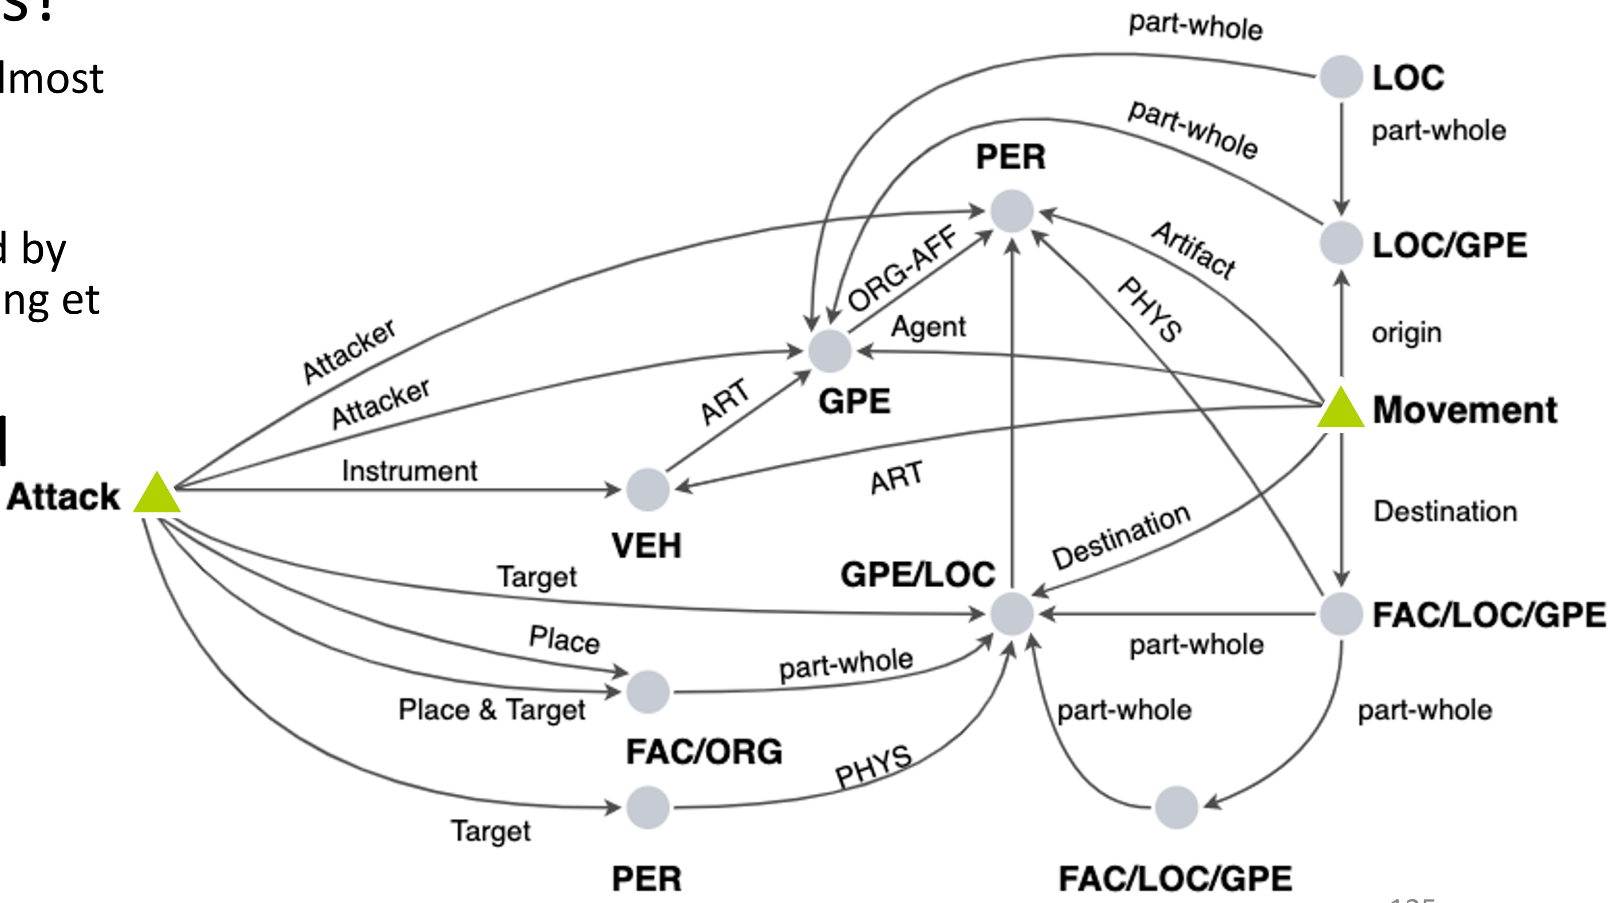
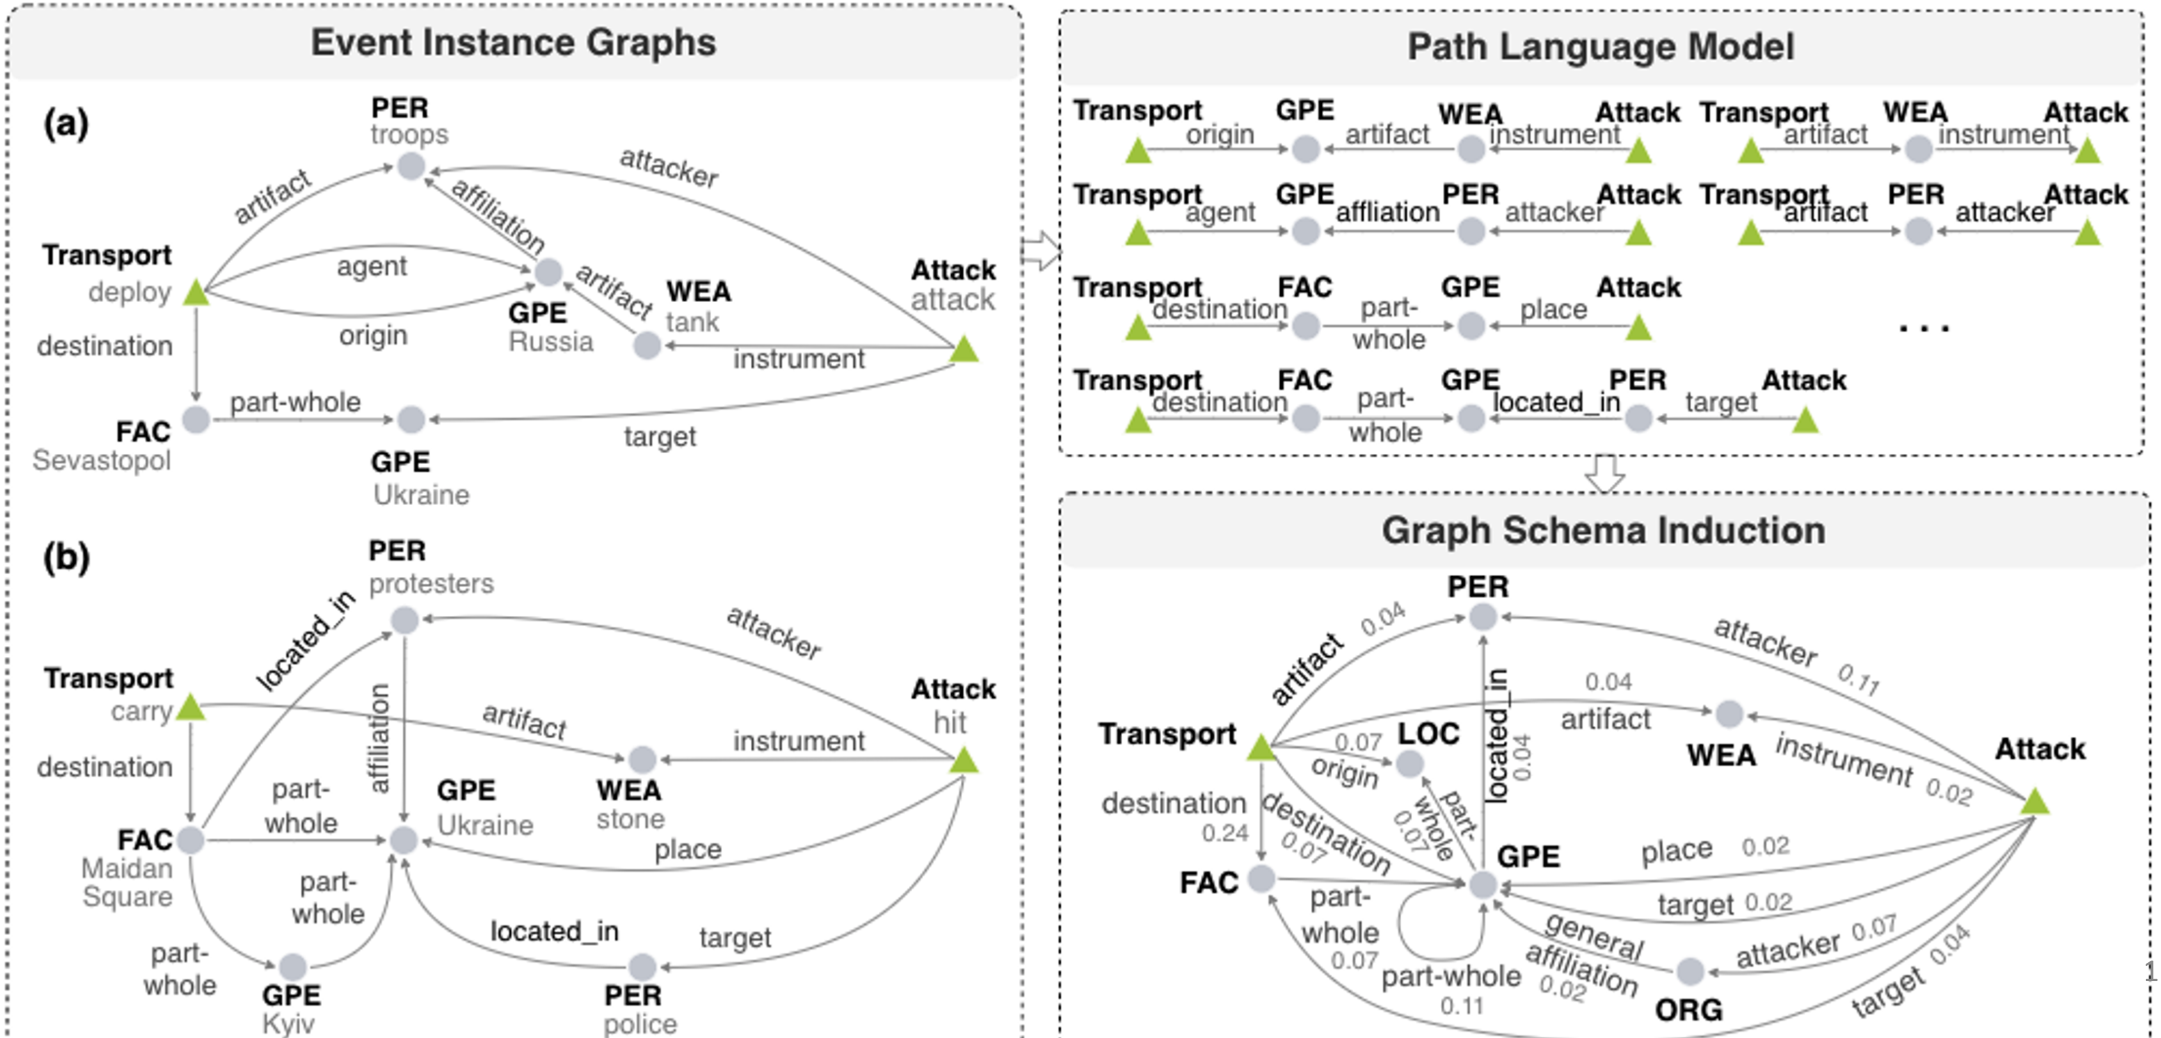
Event Graph Schema Induction

- [Li et al., EMNLP2020]
- How to capture complex connections among events?
  - Temporal relations exist between almost all events, even those that are not semantically related
  - Causal relations have been hobbled by low inter-annotator agreement (Hong et al., 2016)
- Two events are connected through entities and their relations



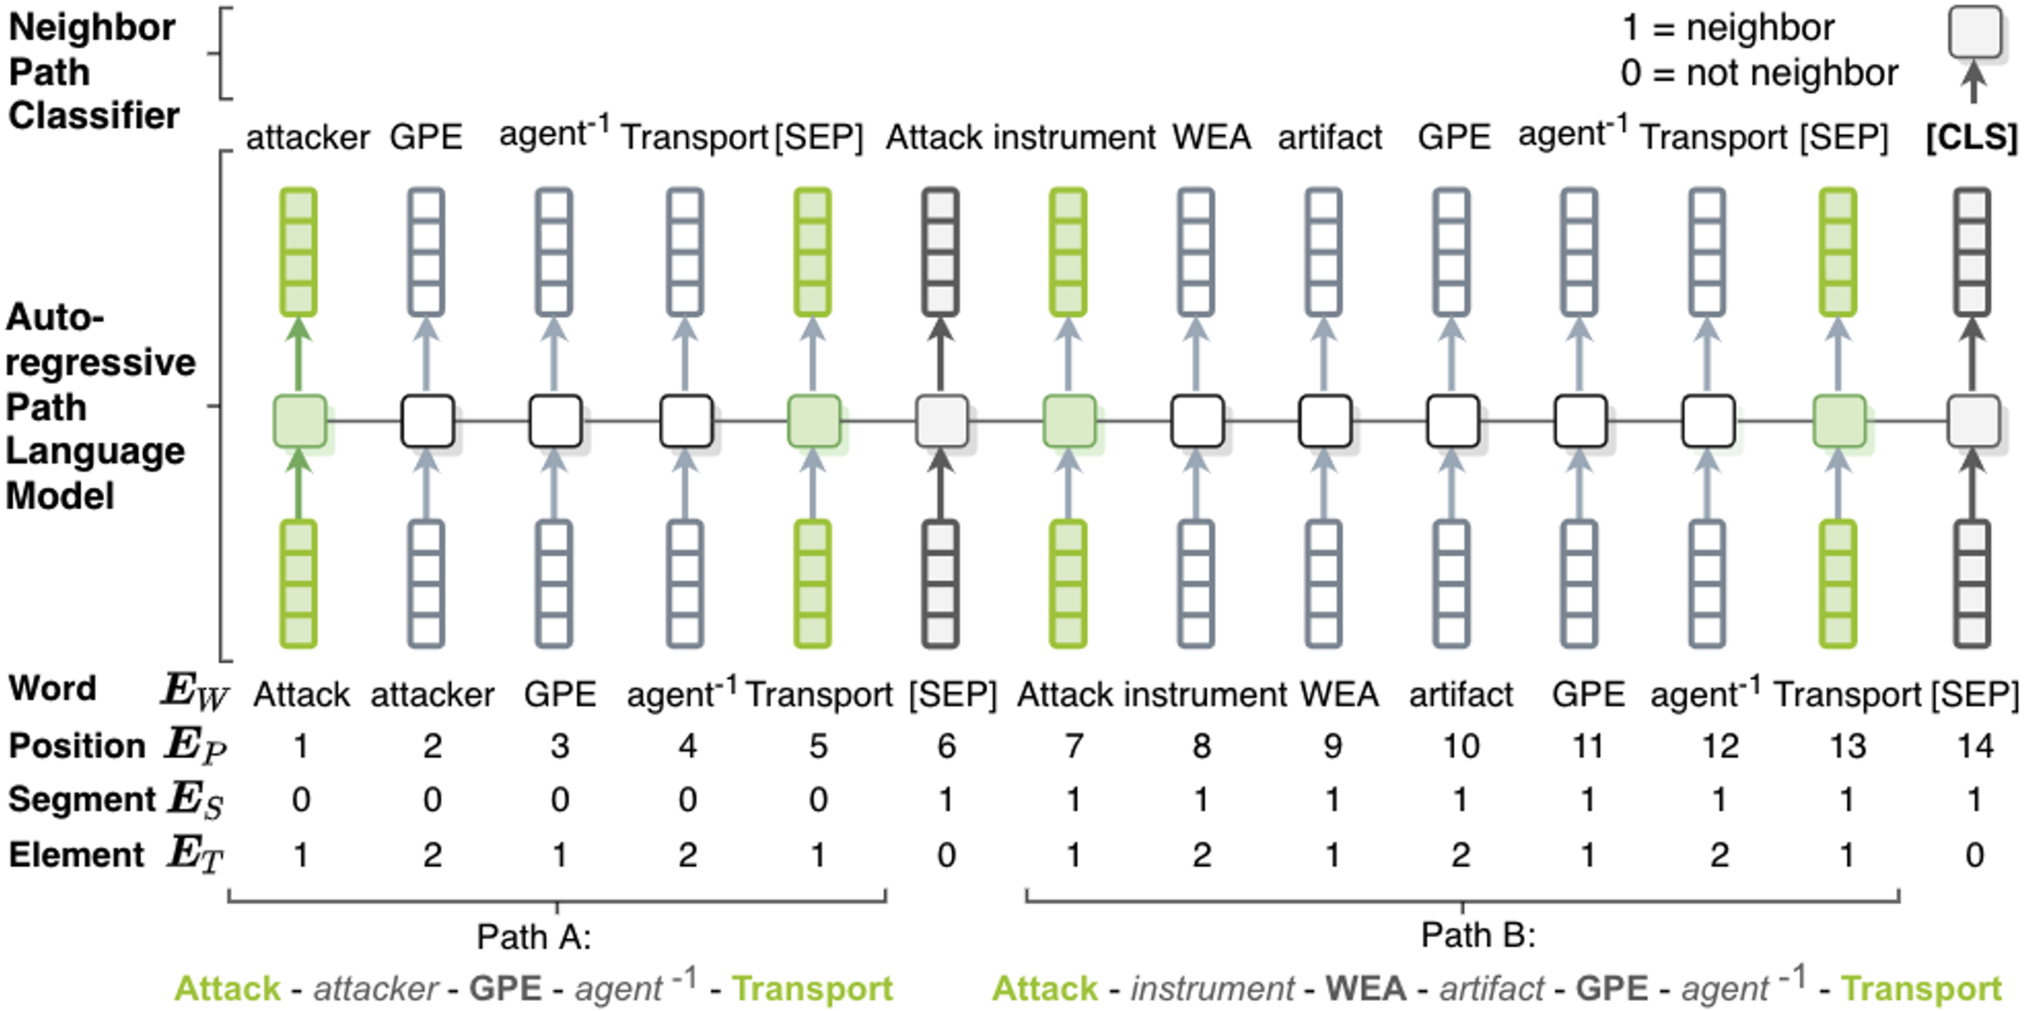
Event Graph Schema Induction

- History repeats itslef: Instance graphs (a) and (b) refer to very different event instances, but they both illustrate a same scenario
- We select salient and coherent paths based on Path Language Model, and merge them into graph schemas



Path Language Model

- Path Language Model is trained on two tasks
  - Autoregressive Language Model Loss: capturing the frequency and coherence of a single path
  - Neighbor Path Classification Loss: capturing co-occurrence of two paths



Word E_W	Attack	attacker	GPE	agent^{-1}	Transport	[SEP]	Attack	instrument	WEA	artifact	GPE	agent^{-1}	Transport	[SEP]
Position E_P	1	2	3	4	5	6	7	8	9	10	11	12	13	14
Segment E_S	0	0	0	0	0	1	1	1	1	1	1	1	1	1

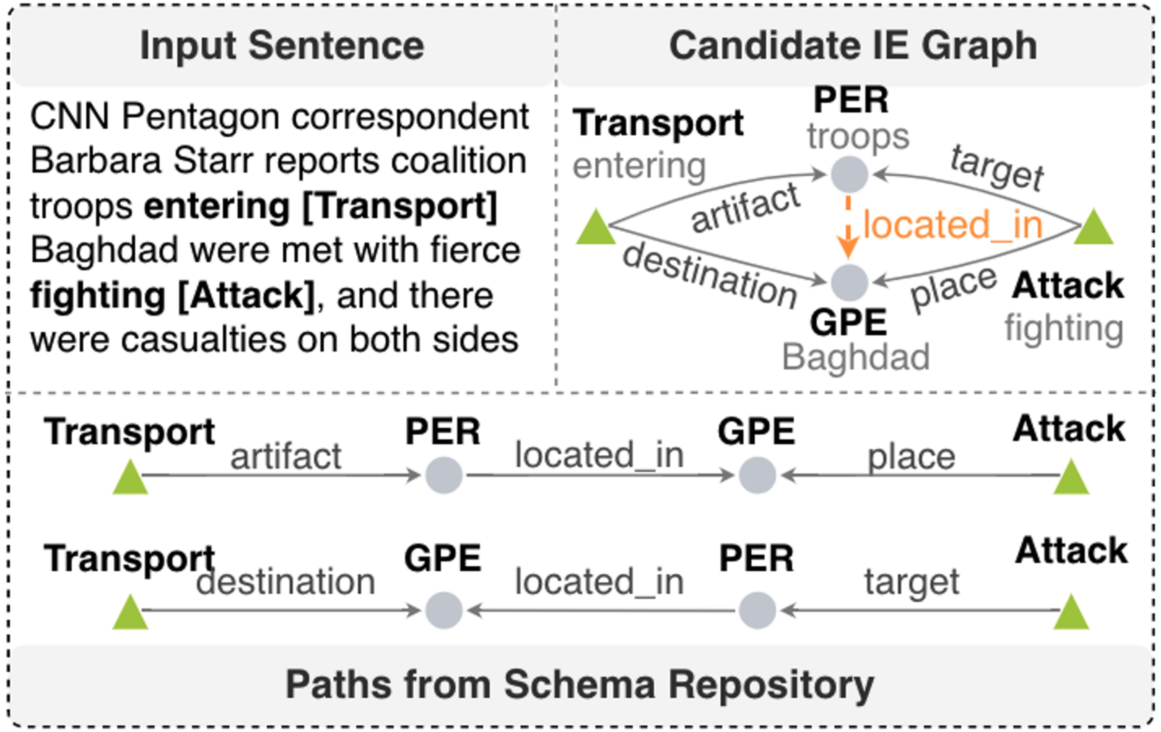
Path A:
Attack - *attacker* - **GPE** - *agent* $^{-1}$ - **Transport**

Path B:
Attack - *instrument* - **WEA** - *artifact* - **GPE** - *agent* $^{-1}$ - **Transport**

Schema-Guided Information Extraction

- Use the state-of-the-art IE system OneIE (Lin et al, 2020) to decode converts each input document into an IE graph
- Each path in the graph schema is encoded as a single global feature for scoring candidate IE graphs
- OneIE promotes candidate IE graphs containing paths matching schema graphs
- http://blender.cs.illinois.edu/software/oneie
- F-scores (%) on ACE2005 data [Lin et al., ACL2020]:



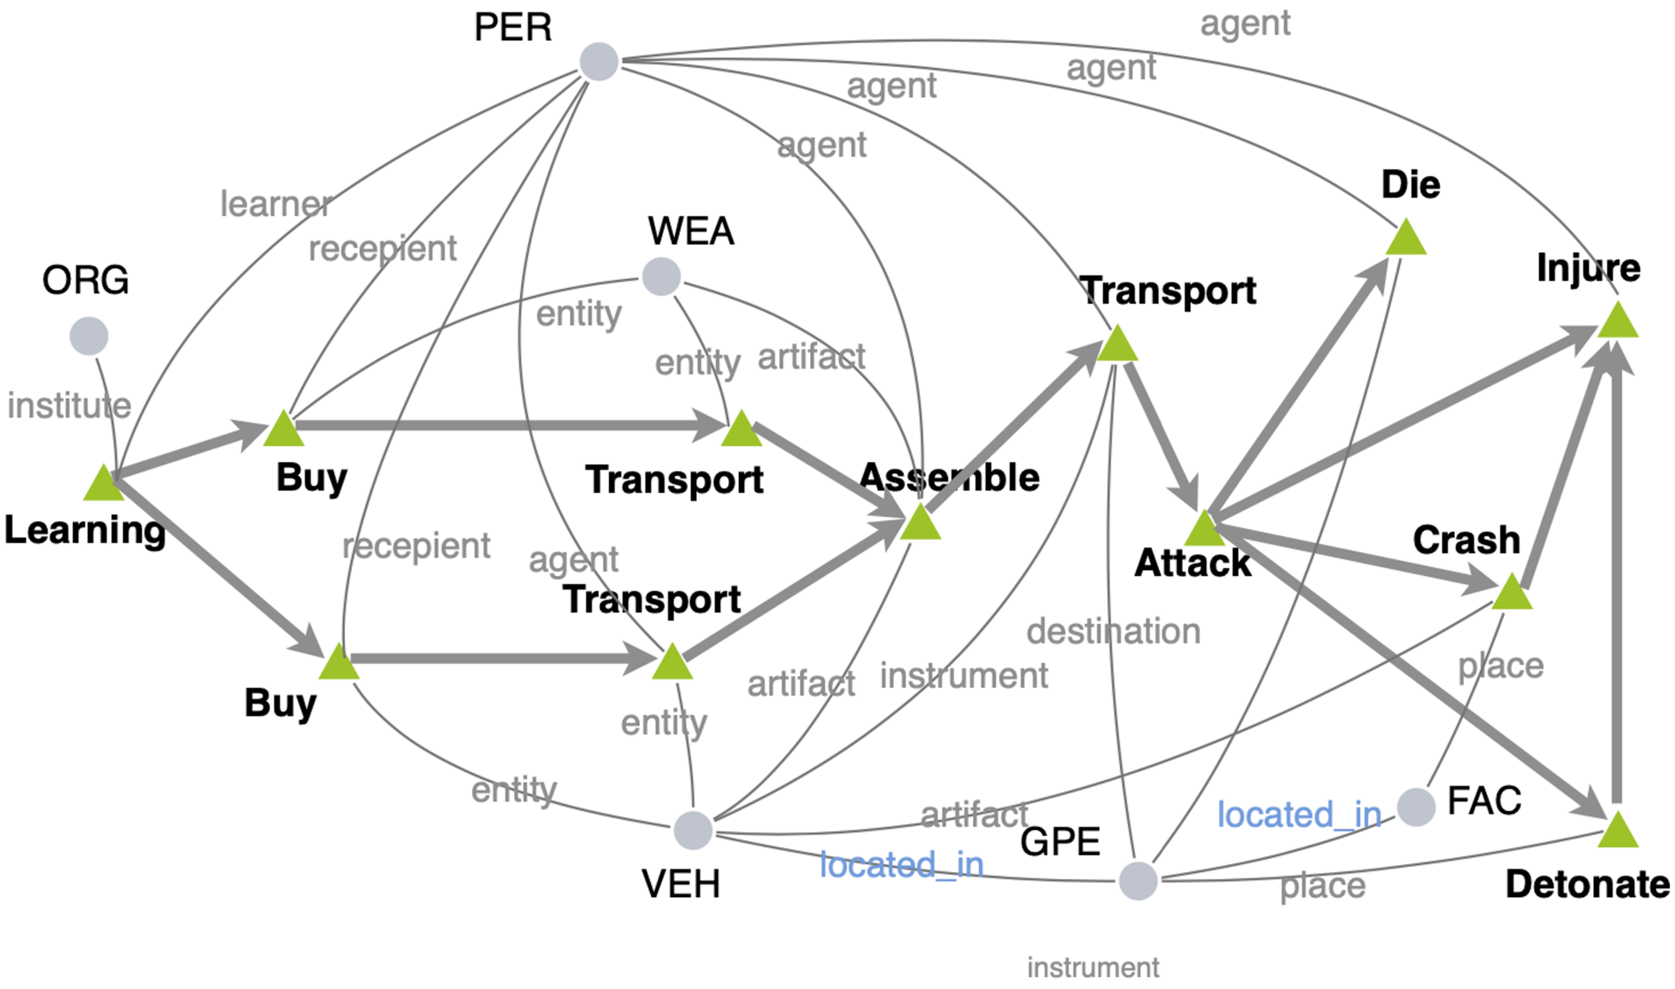
Input Sentence

CNN Pentagon correspondent Barbara Starr reports coalition troops **entering [Transport]** Baghdad were met with fierce **fighting [Attack]**, and there were casualties on both sides

Dataset	Entity	Event Trigger Identification	Event Trigger Classification	Event Argument Identification	**Event Argument** Classification	Relation
Baseline	90.3	75.8	72.7	57.8	55.5	44.7
+PathLM	90.2	**76.0**	**73.4**	**59.0**	**56.6**	**60.9**

Temporal Complex Event Schema Composition

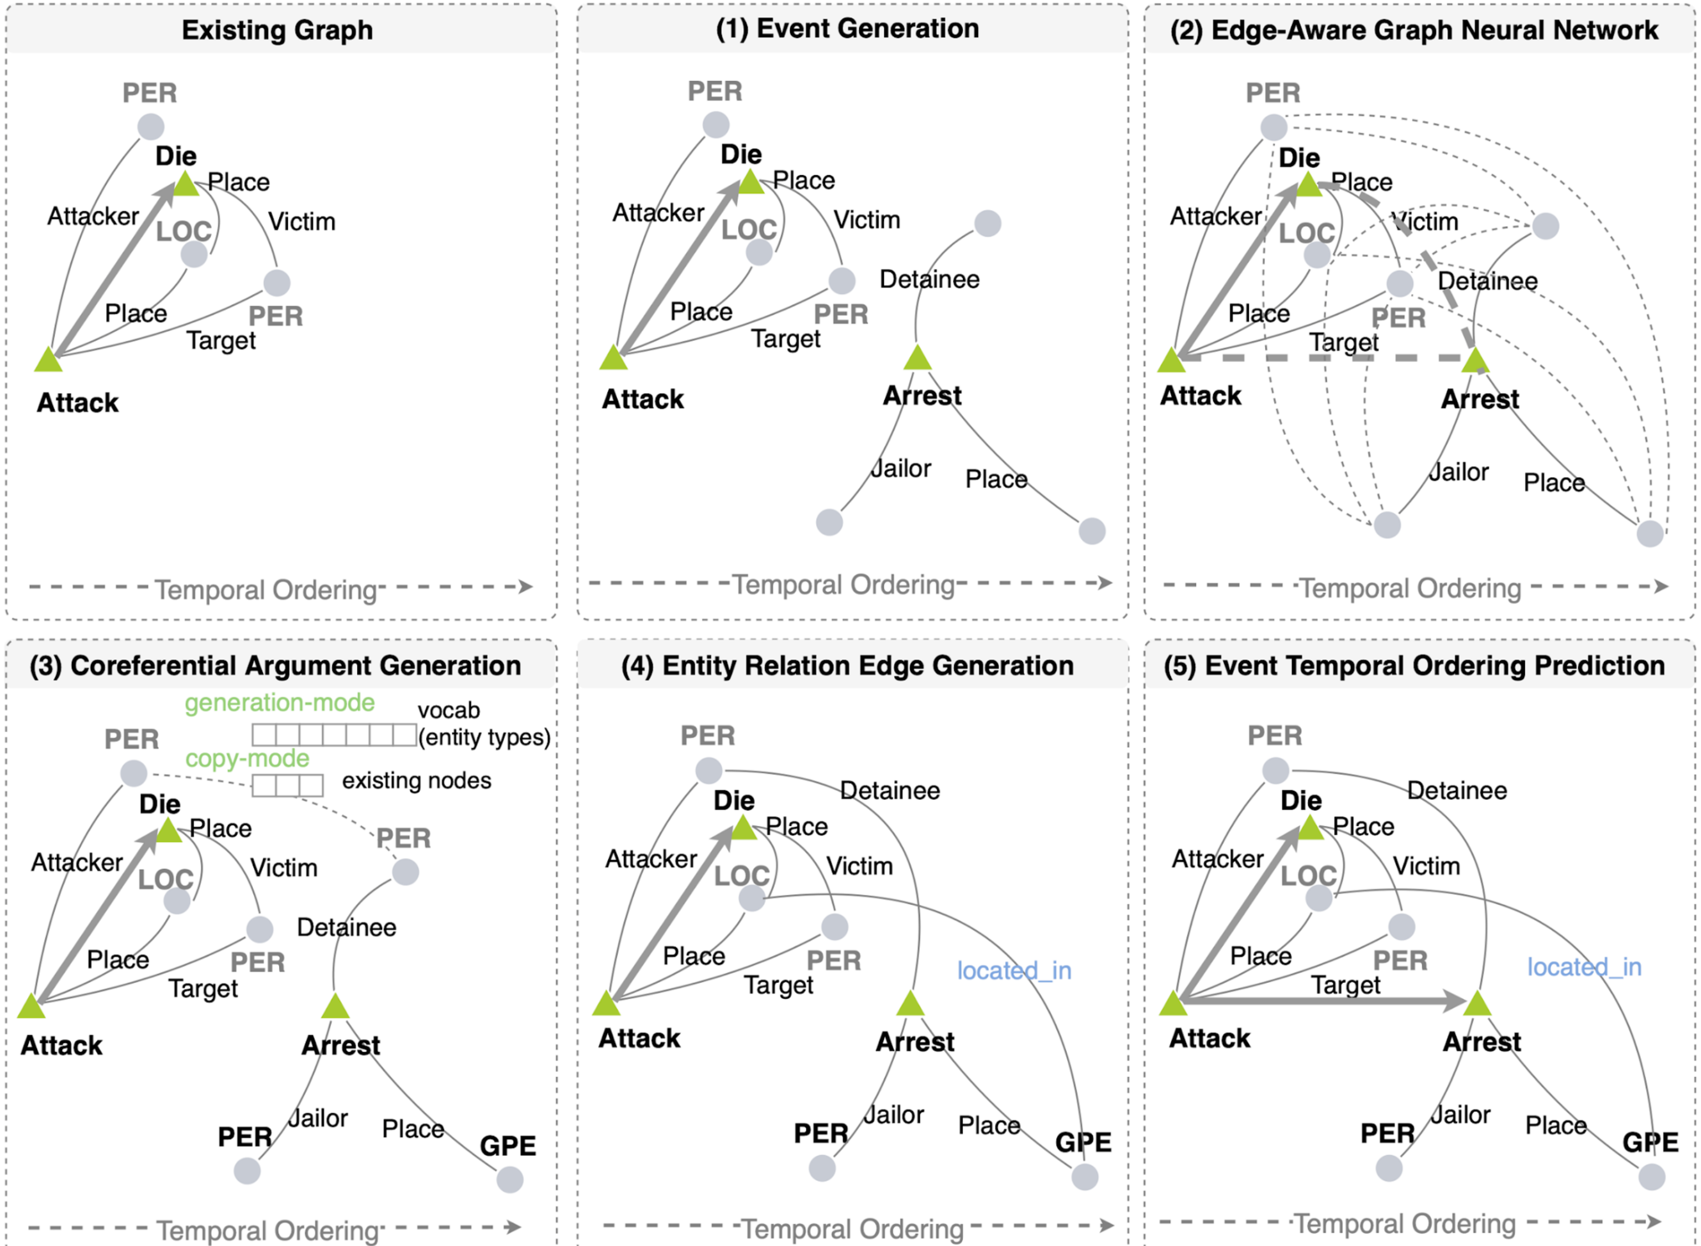
- Graph Structure Aware:
  - Encode entity coreference and entity relation
  - Capture the interdependency of events and entities (sequences can not)
- Scenario guided:
  - Train one model based on instance graphs of the same scenario
- Probabilistic:
  - Support downstream tasks, such as event prediction



Generative Event Graph Model

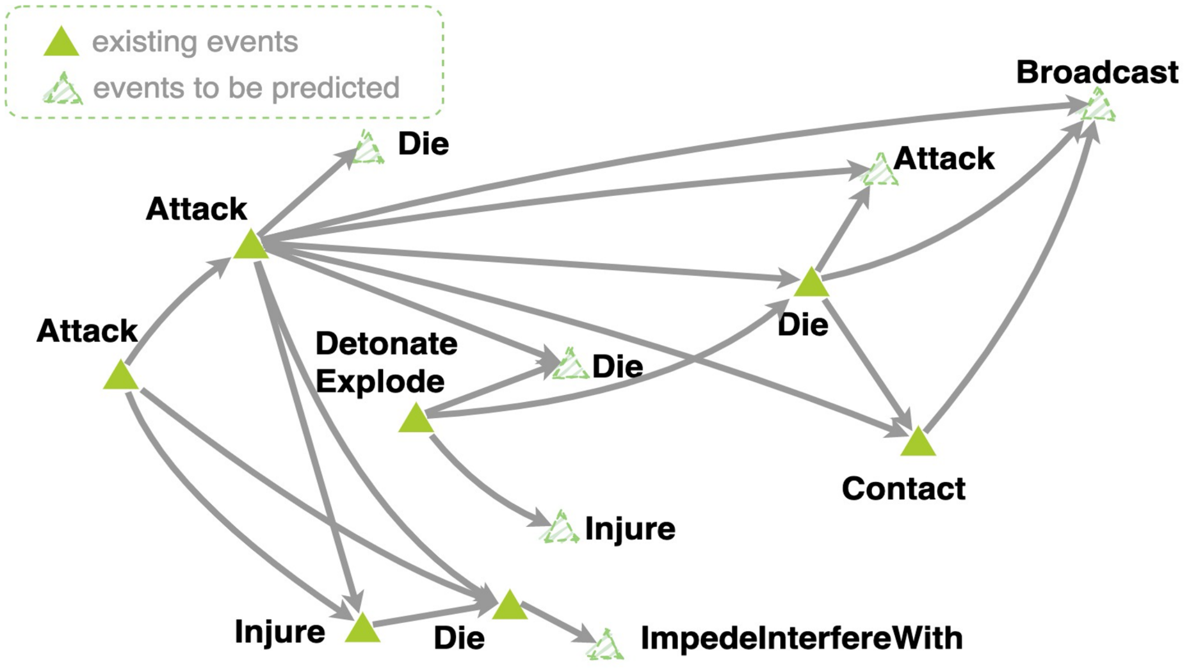
- Schemas are the hidden knowledge to control instance graph generation

- Step 1.
  Event Node Generation
- Step 2.
  Message Passing
- Step 3.
  Argument Node Generation
- Step 4.
  Relation Edge Generation
- Step 5.
  Temporal Edge Generation



Schema-guided Event Prediction

- **Schema-guided Event Prediction:** The task aims to predict ending events of each graph.
  - Considering that there can be multiple ending events in one instance graph, we rank event type prediction scores and adopt MRR and HITS@1 as evaluation metrics.



Event Prediction	
Human Schema	FireExplosion Die TrialHearing Transportation Sentence Broadcast
Graph Temporal Schema	Die Injure Attack Broadcast Arrest

Dataset	Models	MRR	HITS@1
General	Human Schema	0.173	0.205
	Event Graph Model	**0.457**	**0.591**

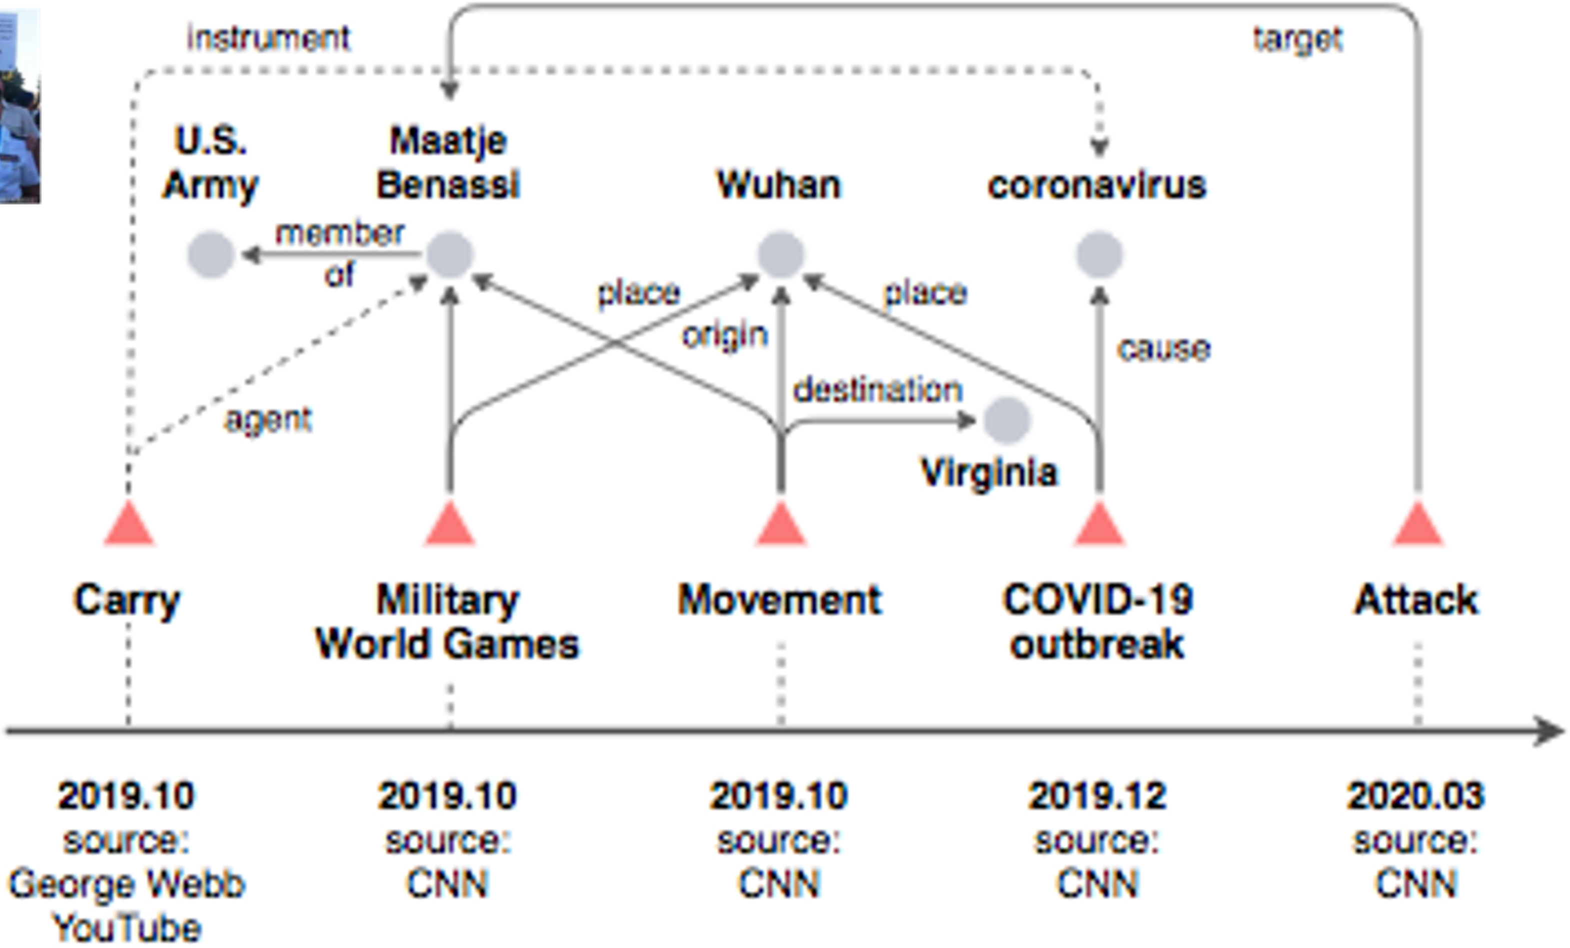
Dataset	Models	MRR	HITS@1
IED	Human Schema	0.072	0.222
	Event Graph Model	**0.203**	**0.426**

Outline

- Semantic Graph Parsing for Event Extraction
- Cross-lingual structure transfer for Relation Extraction and Event Extraction
- Cross-media Structured Common Space for Multimedia Event Extraction
- Graph Schema-guided Event Extraction and Prediction

➢ Cross-media Knowledge Graph based Misinformation Detection

Information Pollution



- Why would anyone ever believe these rumors?
- Because humans are very good at connecting dots
- And perhaps too good →

Quiz Time! Which one is Fake News?

Burma's once-outlawed National League for Democracy is holding its first party congress since the opposition group was founded 25 years ago. Delegates in Rangoon will draw up a policy framework and elect a central committee during the three-day meeting that began Friday. Democracy icon Aung San Suu Kyi is also expected to be reappointed as head of the party. The Nobel laureate helped the NLD to a strong showing in historic April by-elections, which saw the party win 43 of the 45 contested seats. But the NLD is setting its sights on 2015, when it hopes to take power during national elections. But the party faces several challenges as it attempts to fashion itself into a viable political alternative to the military, which still dominates parliament and other government institutions. One of the most pressing issues is electing younger leaders to replace the party's elderly founding members, many of whom are in their 80s or 90s and in poor health.

Congress delegates prepare to pose for photographs as they arrive to attend the National League for Democracy party's (NLD) congress in Rangoon, March 8, 2013.

Delegates from the NLD gather in Rangoon for the party's annual congress. The NLD is headed by Nobel Peace Prize winner Aung San Suu Kyi. The party is expected to win a majority of seats in the parliament.

This year's NLD Congress is the first time the party has been able to elect its own leadership. Nyan Win, a member of NLD's executive committee, told VOA that the party is looking forward to the new generation of leaders.

The party has come a long way since the military seized power in 1962. The NLD was founded by a Briton. Since then, Burma has been ruled by a quasi-civilian government. However, the military has still maintained tight control over the country's political institutions. Phil Robertson, Asia director for Human Rights Watch, said he hopes the party will push forward with reforms that will allow the army to step down and allow the civilian government to take over.

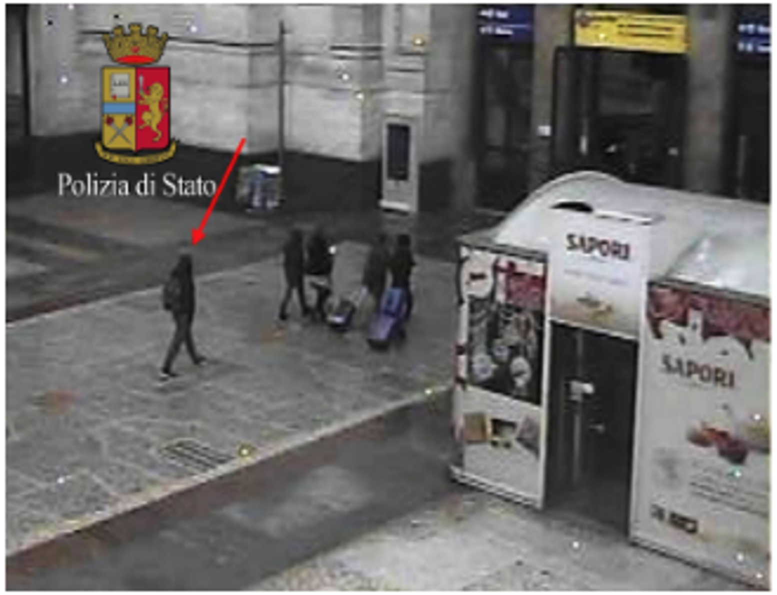
Quiz Time! Which Caption is Fake?

On 24 May 2017 the Philippines militants left their barrack in the outskirts of southern Marawi city to reinforce fellow troops who had been under siege by Islamic troops.

Philippine troops arrive at their barracks to reinforce fellow troops following the siege by Muslim militants, on the outskirts of Marawi city in the southern Philippines, May 24, 2017.

Quiz Time! Which Caption is Fake?

Anis Amri (L), the Tunisian suspect of the Berlin Christmas market attack, is seen in this photo taken from security cameras at the Milan Central Train Station in downtown Milan, Italy December 23, 2016.



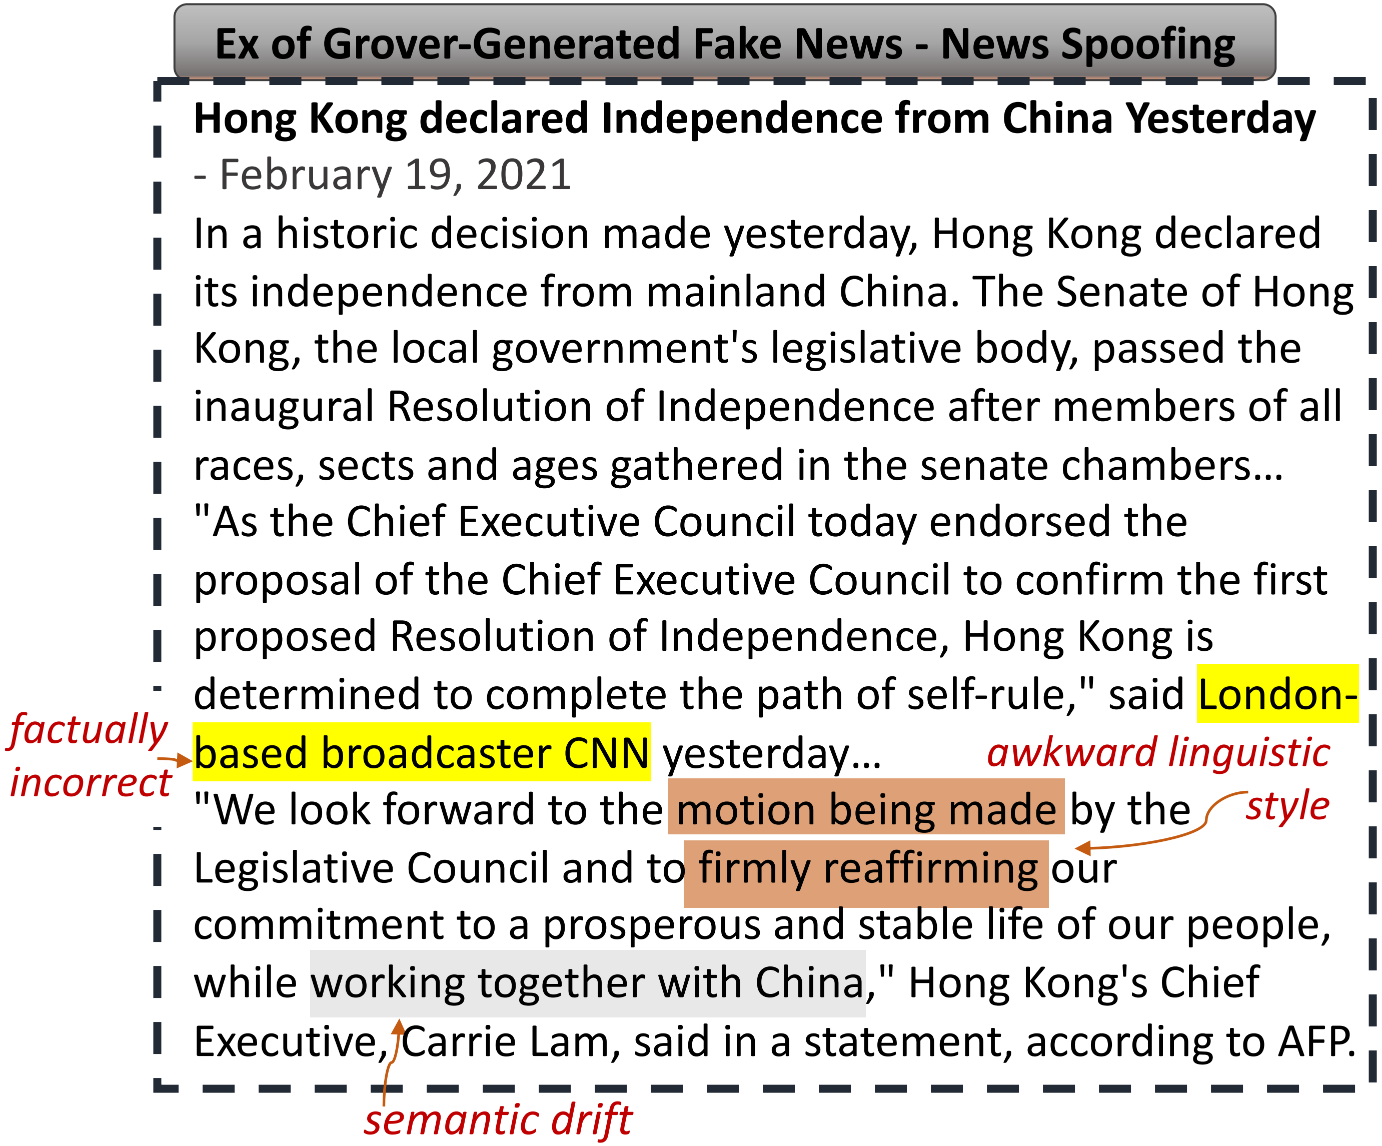
Anis Amri, a Tunisian suspected of defending the Christmas market in Milan, was seen in this photo given from a security camera at the Central Train Station of downtown Berlin on 23 December 2016 .

Knowledge Element-Level Misinformation Detection [Fung et al., ACL2021]

<u>Motivation</u>: misinformative parts of a fake news article lie along the fine-grained details

<u>Current Issues</u>:

- Fake news detection approaches tend to focus on checking facts, semantic inconsistencies, style or bias, lacking a *unified framework*.
- The document-level detection task lacks *precision* and *explainability*



Ex of Grover-Generated Fake News - News Spoofing

Hong Kong declared Independence from China Yesterday

- February 19, 2021

In a historic decision made yesterday, Hong Kong declared its independence from mainland China. The Senate of Hong Kong, the local government's legislative body, passed the inaugural Resolution of Independence after members of all races, sects and ages gathered in the senate chambers… "As the Chief Executive Council today endorsed the proposal of the Chief Executive Council to confirm the first proposed Resolution of Independence, Hong Kong is determined to complete the path of self-rule," said London-based broadcaster CNN yesterday… "We look forward to the motion being made by the Legislative Council and to firmly reaffirming our commitment to a prosperous and stable life of our people, while working together with China," Hong Kong's Chief Executive, Carrie Lam, said in a statement, according to AFP.

Compare with Previous Work

- Motivation: misinformative parts of a fake news article lie along the fine-grained details
  - Existing approaches lack a *unified framework* in checking facts, semantic inconsistencies, text features and bias

	Text Features	Structured Knowledge	Source Bias	Multimedia	Knowledge Element Level Detection

Police Brutality in HK at new Extreme Levels

Aug 11, 2019 Lisa Lu

Police brutality has risen to a new, extreme level in HK this past weekend. HK police started shooting at protestors on the streets, including the unarmed, peaceful protestors. One notable incidence involved a woman at the Tsim Sha Tsui bus stop being shot in the eye by a policeman hiding behind corners. No warning was issued beforehand, and the woman was permanently blinded. Local activists are avidly calling for international attention on the HK police brutality.

HK police shoot cold bullets at protestors from hidden corners.

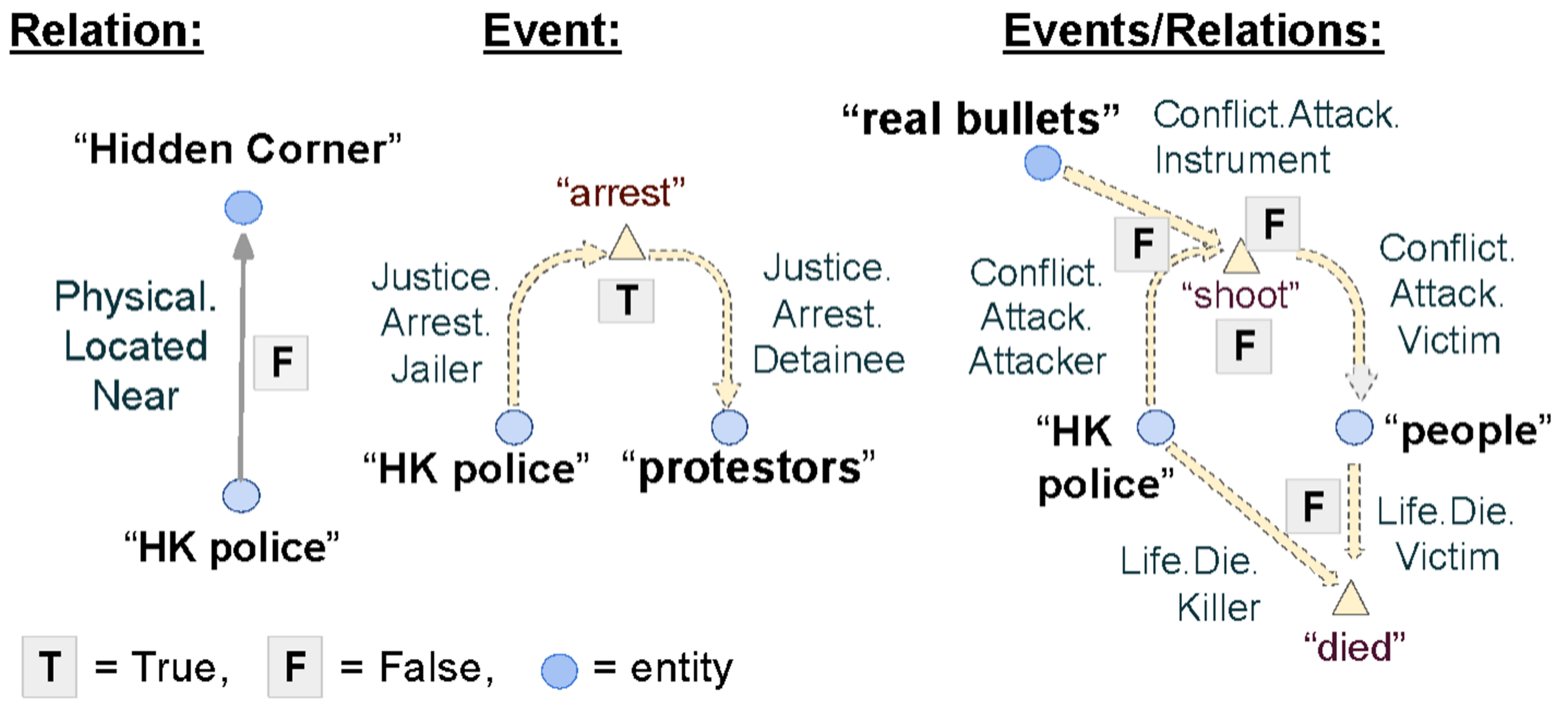
{<police, located in, hidden corner>, <police, blinded, the woman>}

InfoSurgeon

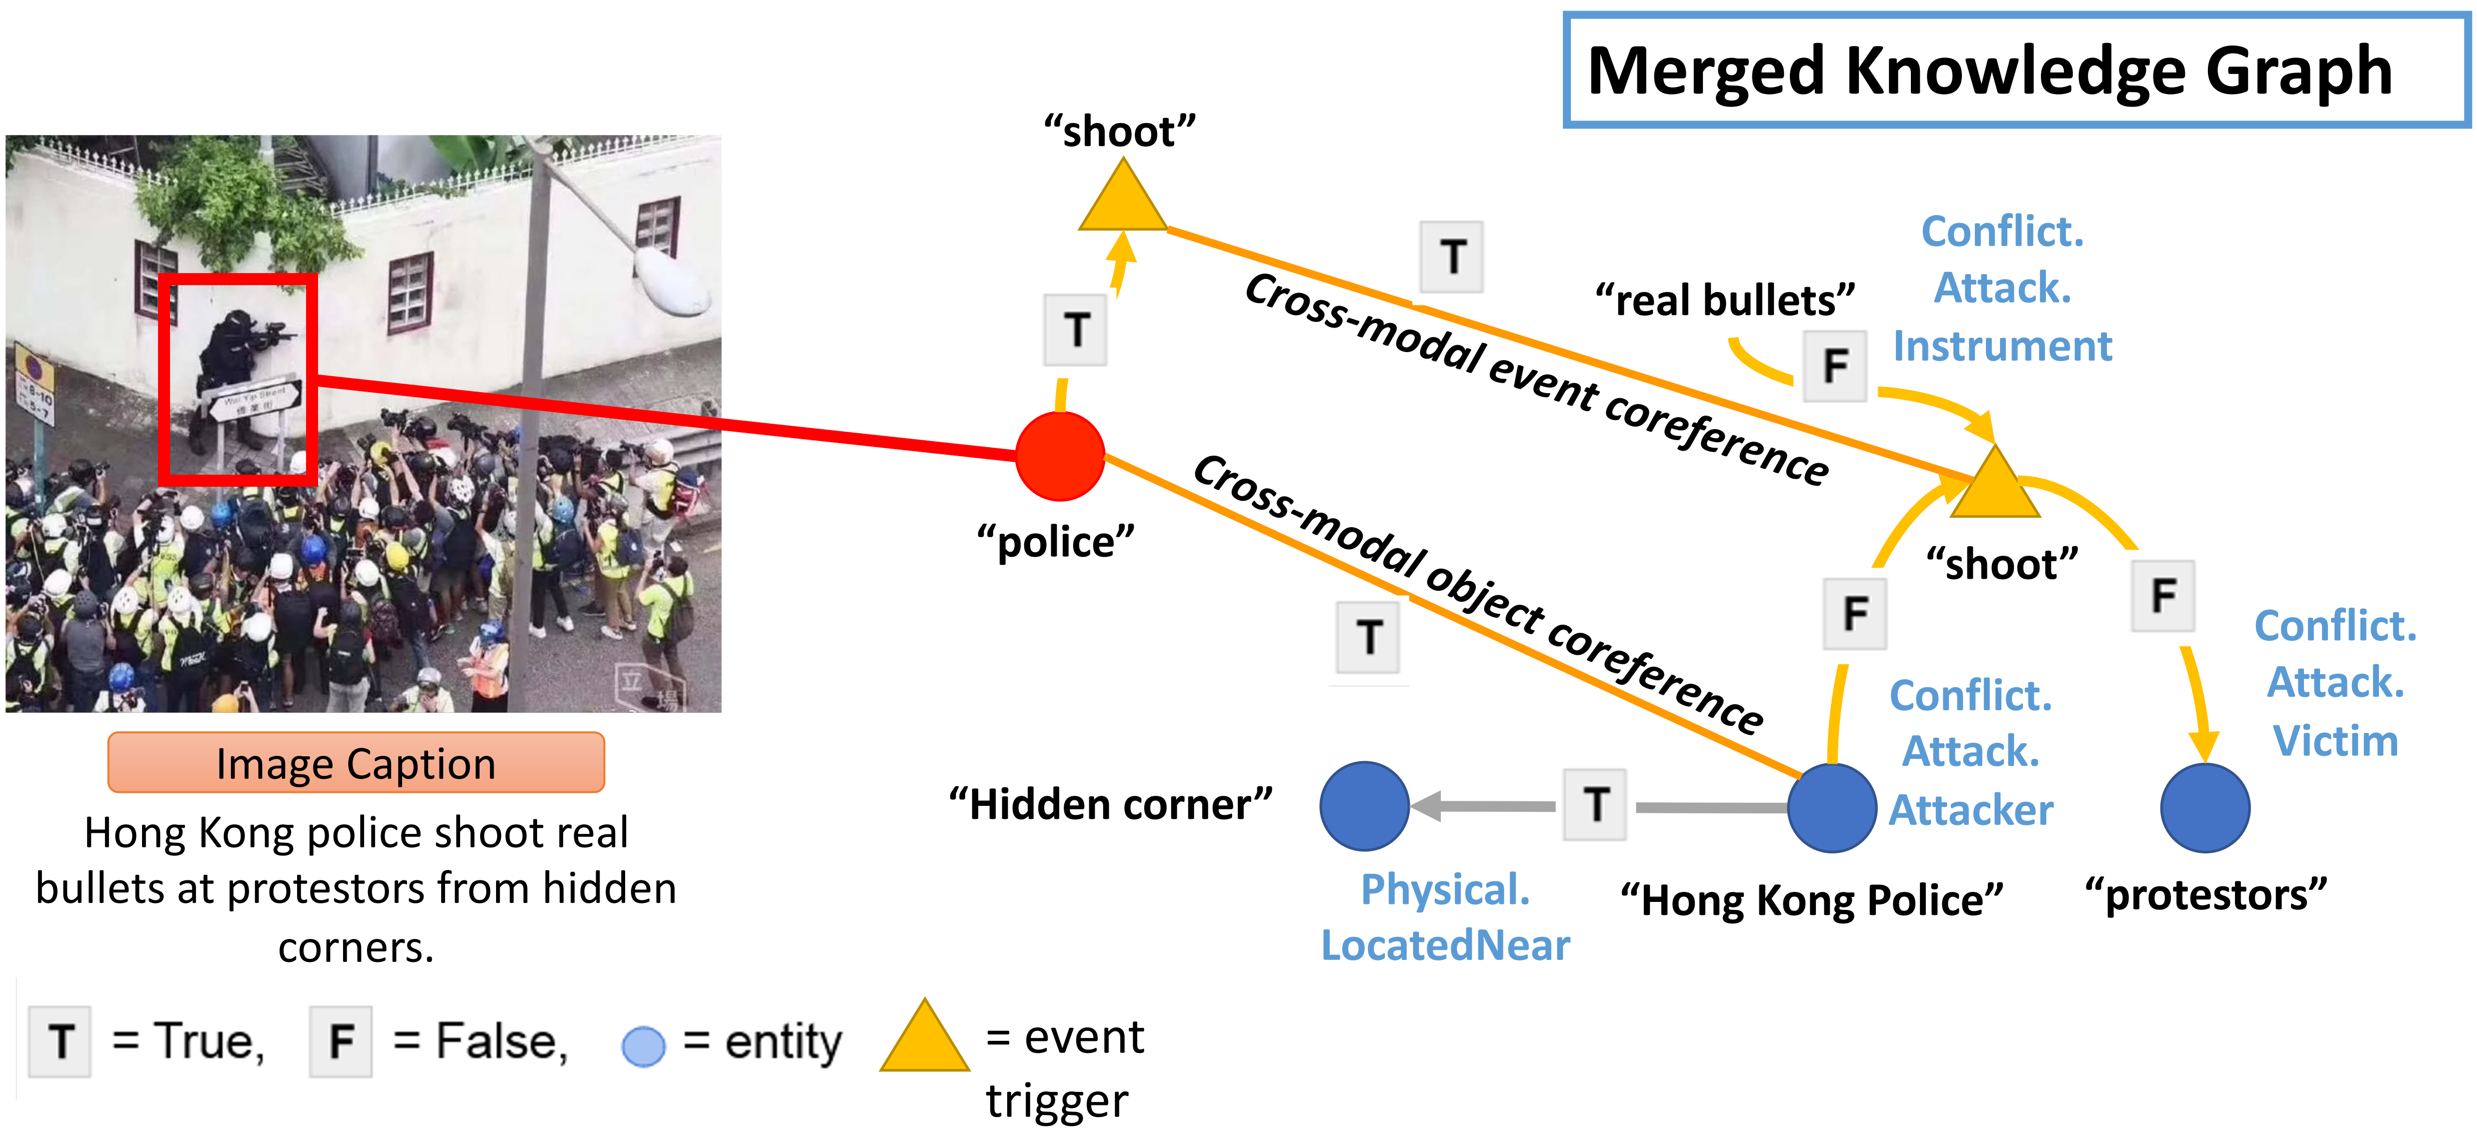
Knowledge Element-Level Misinformation Detection

We also propose a new task in addition to document-level fake news detection that is more challenging but interesting.

Label each triplet connecting two entities as True/False



Multimedia Knowledge Graph Construction



Hong Kong police shoot real bullets at protestors from hidden corners.

"InfoSurgeon: Cross-Media Fine-grained Information Consistency Checking for Fake News Detection". *In submission to ACL 2021*

KG-Conditional Fake News Generation

- Annotating specifically which elements in a KG are fake is time-intensive / difficult
- We propose a solution to automatically obtain knowledge-element labeled knowledge graphs for free
- Given a set of real news articles, we extract KGs from the real articles
- Train a text generator model that learns to recreate an article from its KG
- To generate fake data, perform manipulation operations on the KG (editing knowledge relations, events, entities, etc.) to produce KG’
- Generate a fake article from KG’
- Key insight – We now know specifically which elements in KG’ were manipulated!

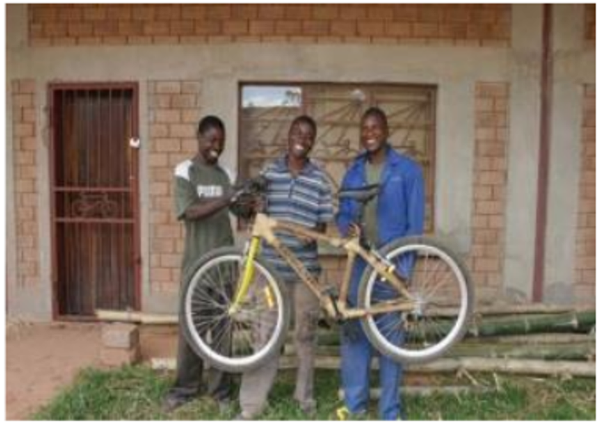
Manipulated KG-to-Article Synthesis

- We perform the following manipulations on KGs:
- **Entity swapping** – Swapping entity that has same type and similar embedding (so they are harder to tell apart)
- **Addition of new relation or event** – Randomly select relation / event argument roles and append a new entity to the relation / event
- **Subgraph replacement** – Select a subgraph of the news article from an entity and replace it with a subgraph from another news article

Generating Text from Structured Representations

No Cross-media Manipulation Constraints

Article Image



Manipulated KG

```
<team,Manufacture.Artifact_Ar
tifact.Artifact_Manufacturer,
Zambia>
<Zambia,Manufacture.Artifact_
Manufacturer, men> ...
<~~bicycle~~> <truck> <hospital>
```

Generated Article

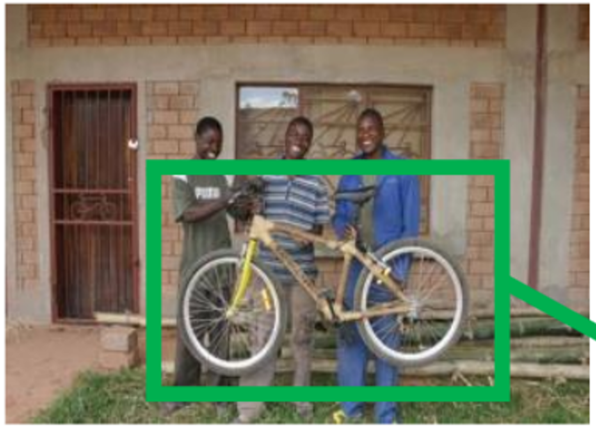
The Zambia-based Bamboo **truck** is the first of its kind in the world, and it’s designed to be a cheaper and lighter alternative to the traditional, heavy-duty, imported, metal ambulance. The Zambian-designed **truck** is built of bamboo, which is an environmentally friendly material…

- We manipulate knowledge graphs to synthesize fake news which contain known types of inconsistencies.
- This example is trivially detectable due to a inconsistency with the image

Generating Text from Structured Representations

With Cross-media Manipulation Constraints

Article Image



Manipulated KG

<team,Manufacture.Artifact_Artifact.Artifact_Manufacturer, ~~Zambia~~**Fiji**>
<~~Zambia~~**Fiji**,Manufacture.Artifact_Manufacturer, men> ...
<**bicycle**> <hospital> ...

Generated Article

A team of two Californians living in **Fiji** is trying to build the world’s smallest and most affordable bicycle. They are using bamboo as the frame for their bicycles. The team is made up of 25 young men who met at a university in the Pacific island nation of **Fiji**. They’re using their...

- By imposing cross-media knowledge graph manipulation constraints, we **prevent generating text with obvious inconsistencies**.
- Enables generating more realistic / challenging data for training detector

Caption Manipulation – AMR-to-Caption Synthesis

- Use text parser to get AMR graphs (Banarescu et al., 2013) from captions
- Use AMR since they capture fine-grained relations expressing who does what to whom
- Manipulations:
  - **Role switching –** Swapping entity positions in AMR graph
  - **Predicate negation –** Replace triggers / verbs with antonyms from WordNet
- Use off-the-shelf model for AMR to text synthesis (Ribeiro et al, 2020)

True Caption:
In Afghanistan, the Taliban released to the media this picture, which it said shows the suicide bombers who attacked the army base in Mazar-i-Sharif, April 21, 2017

Fake caption:
On 21 April 2017 the Taliban released this picture to the army in Afghanistan which they said was a suicide bomber hiding at a media base in the city of Mazar-i-Sharif

- **Ethical Statement: we are not going to share our generator, but sharing our detector!**

Knowledge Element-Level Misinformation Dataset

- To address the lack of data for the detection task, we further contribute a KG2txt fake news generation approach, which allows for control over knowledge element manipulation and creating silver standard annotation data.

	Overall	Real Documents	Fake Documents
Human Detection Accuracy	61.3%	80.4%	42.3%

The Turing Test results above show that our automatically generated fake documents are also very hard for humans to detect.

Knowledge Element-Level Misinformation Detection

Experimental result on traditional document-level detection:

	NYTimes Neural News Dataset	VOA Manipulated KG2Txt Dataset
Grover	56.0%	86.4%
DIDAN	77.6%	88.3%
InfoSurgeon (Our Model)	**94.5%**	**92.1%**

Experimental result on the novel task, knowledge element level misinformation detection:

	VOA Manipulated KG2Txt Dataset
Random (baseline)	27%
InfoSurgeon (Our Model)	**37%**

A Successful Example

- Example of fake news article in which baseline misses, but *InfoSurgeon* successfully detects

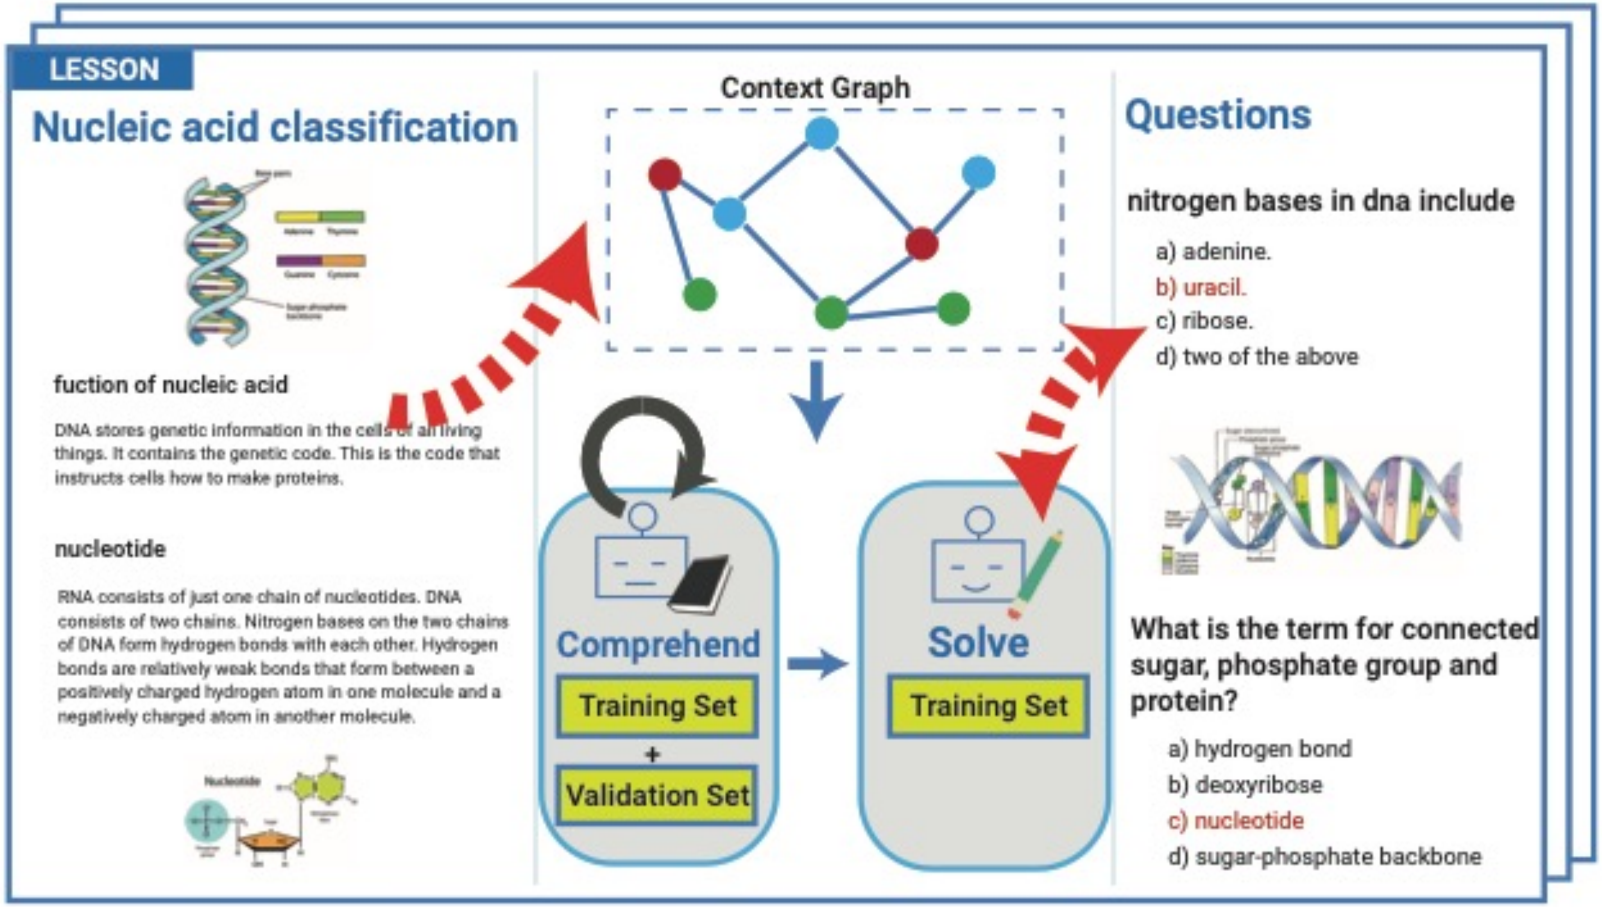
TQA: Textbook Question Answering

[Kim et al., ACL'19]



LESSON

Nucleic acid classification

fuction of nucleic acid

DNA stores genetic information in the cells of all living things. It contains the genetic code. This is the code that instructs cells how to make proteins.

nucleotide

RNA consists of just one chain of nucleotides. DNA consists of two chains. Nitrogen bases on the two chains of DNA form hydrogen bonds with each other. Hydrogen bonds are relatively weak bonds that form between a positively charged hydrogen atom in one molecule and a negatively charged atom in another molecule.

Questions

nitrogen bases in dna include

a) adenine.
b) uracil.
c) ribose.
d) two of the above

What is the term for connected sugar, phosphate group and protein?

a) hydrogen bond
b) deoxyribose
c) nucleotide
d) sugar-phosphate backbone

Kim et al. **Textbook Question Answering with Multi-modal Context Graph Understanding and Self-supervised Open-set Comprehension** ACL'19

Textbook Question Answering

[Kim et al., ACL’19]

- Key challenges:
  - Multi-modality
  - Long context
  - Difficulty to solve unseen problems

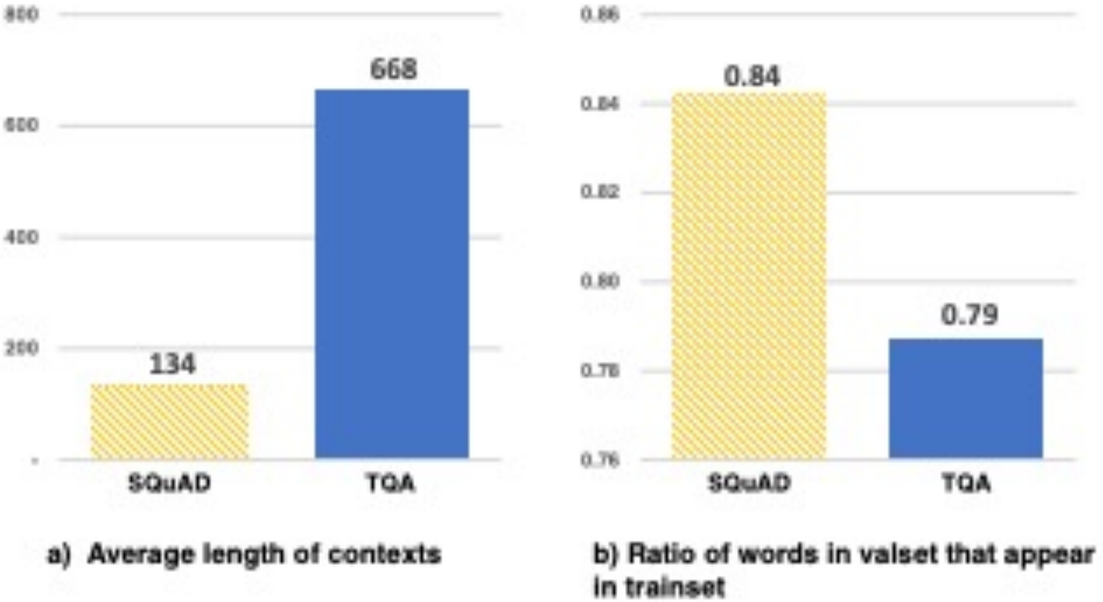


Figure 2: Analysis of contexts in TQA and SQuAD datasets.

TQA: Textbook Question Answering

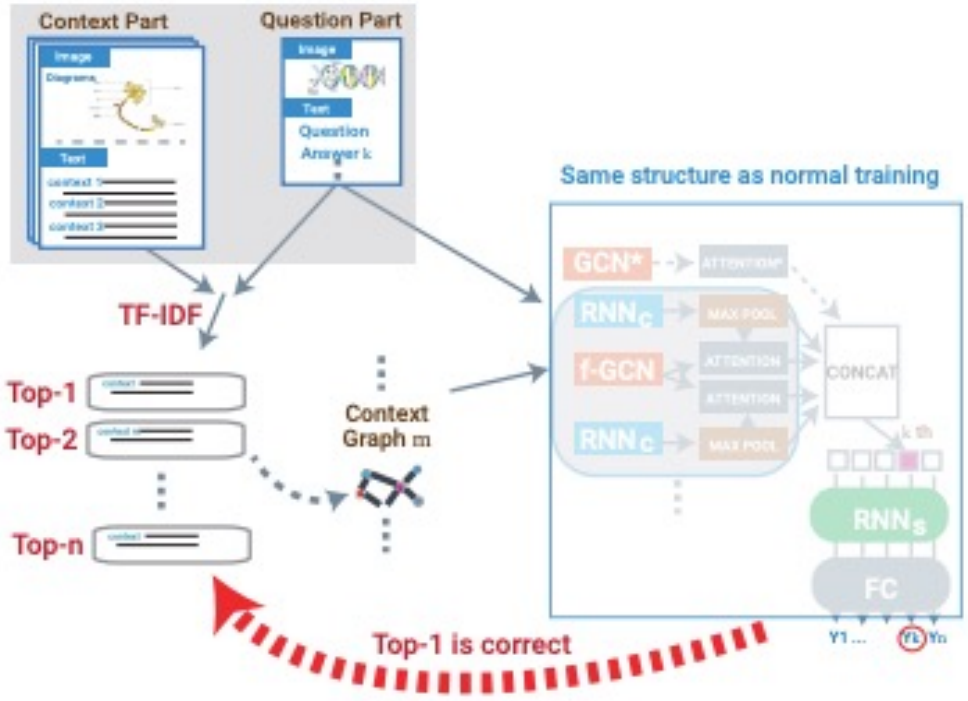
[Kim et al., ACL'19]

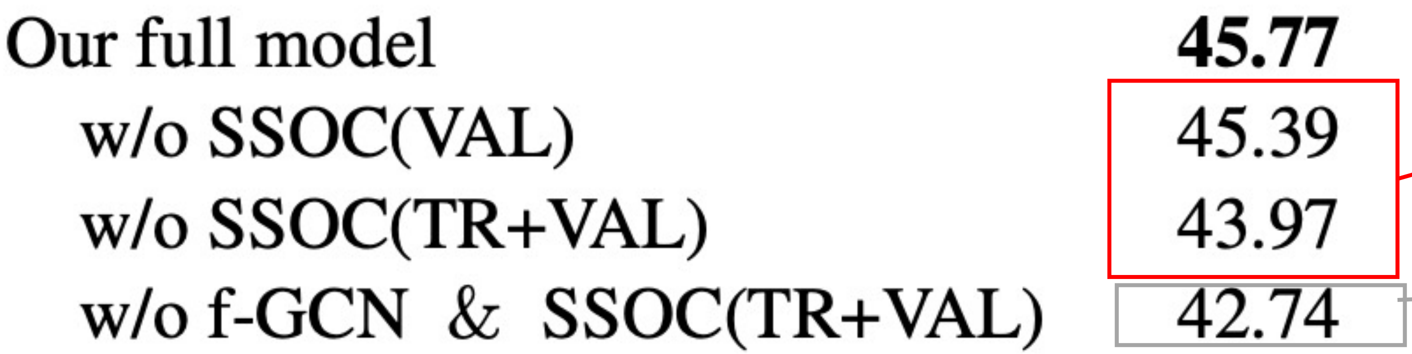
- Self-training: reads and understands a textbook and problems in advance.



Kim et al. **Textbook Question Answering with Multi-modal Context Graph Understanding and Self-supervised Open-set Comprehension** ACL'19

TQA: Textbook Question Answering

[Kim et al., ACL’19]



Our full model	**45.77**
w/o SSOC(VAL)	45.39
w/o SSOC(TR+VAL)	43.97
w/o f-GCN & SSOC(TR+VAL)	42.74

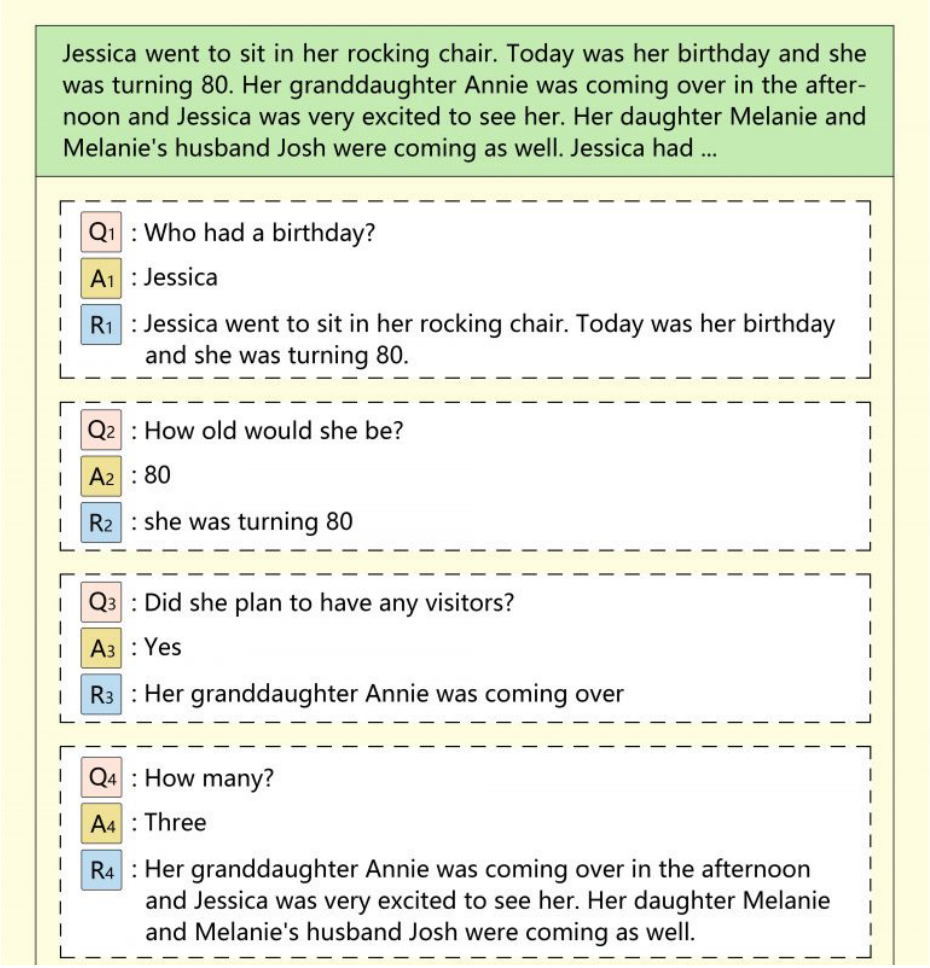
Self-training, even only on training, **is useful**

Context Graph is effective

Kim et al. **Textbook Question Answering with Multi-modal Context Graph Understanding and Self-supervised Open-set Comprehension** ACL’19

Conversational Machine Comprehension

[Chen et al, IJCAI’20]



Jessica went to sit in her rocking chair. Today was her birthday and she was turning 80. Her granddaughter Annie was coming over in the afternoon and Jessica was very excited to see her. Her daughter Melanie and Melanie's husband Josh were coming as well. Jessica had ...

Q_1 : Who had a birthday?

A_1 : Jessica

R_1 : Jessica went to sit in her rocking chair. Today was her birthday and she was turning 80.

Q_2 : How old would she be?

A_2 : 80

R_2 : she was turning 80

Q_3 : Did she plan to have any visitors?

A_3 : Yes

R_3 : Her granddaughter Annie was coming over

Q_4 : How many?

A_4 : Three

R_4 : Her granddaughter Annie was coming over in the afternoon and Jessica was very excited to see her. Her daughter Melanie and Melanie's husband Josh were coming as well.

Challenges:

- Focus shift
- Coreference or ellipsis

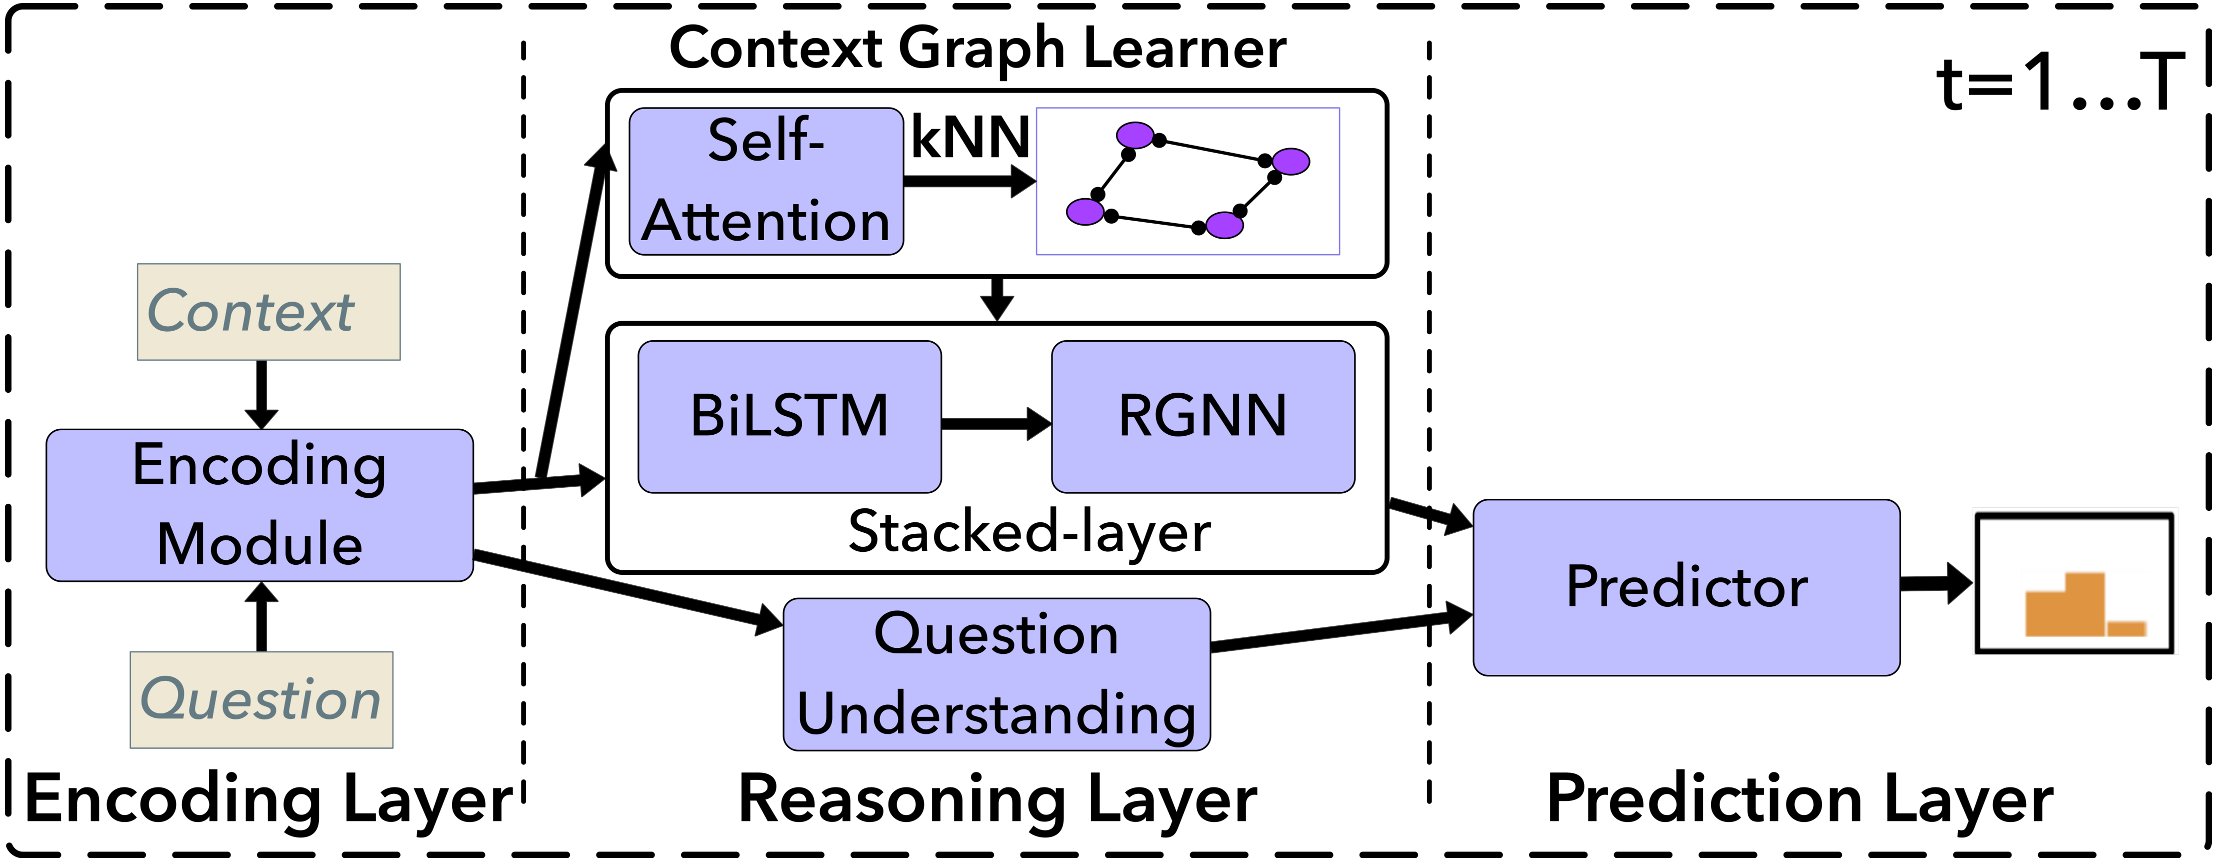
Conversational Machine Comprehension

[Chen et al, IJCAI'20]



Chen et al. **GraphFlow: Exploiting Conversation Flow with Graph Neural Networks for Conversational Machine Comprehension** IJCAI'20

Conversational Machine Comprehension

[Chen et al, IJCAI’20]

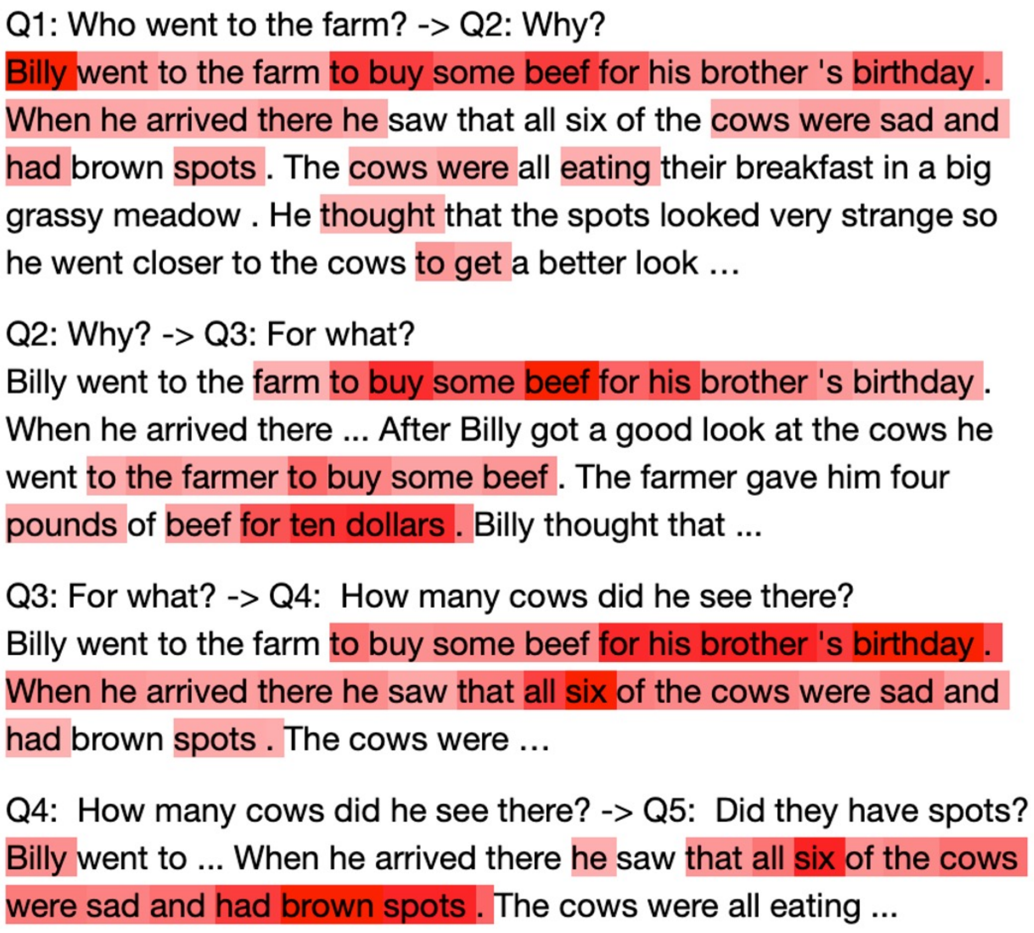
GraphFlow’s focus shifts between consecutive question turns.



Q1: Who went to the farm? -> Q2: Why?

Billy went to the farm to buy some beef for his brother 's birthday . When he arrived there he saw that all six of the cows were sad and had brown spots . The cows were all eating their breakfast in a big grassy meadow . He thought that the spots looked very strange so he went closer to the cows to get a better look …

Q2: Why? -> Q3: For what?

Billy went to the farm to buy some beef for his brother 's birthday . When he arrived there ... After Billy got a good look at the cows he went to the farmer to buy some beef . The farmer gave him four pounds of beef for ten dollars . Billy thought that ...

Q3: For what? -> Q4: How many cows did he see there?

Billy went to the farm to buy some beef for his brother 's birthday . When he arrived there he saw that all six of the cows were sad and had brown spots . The cows were …

Q4: How many cows did he see there? -> Q5: Did they have spots?

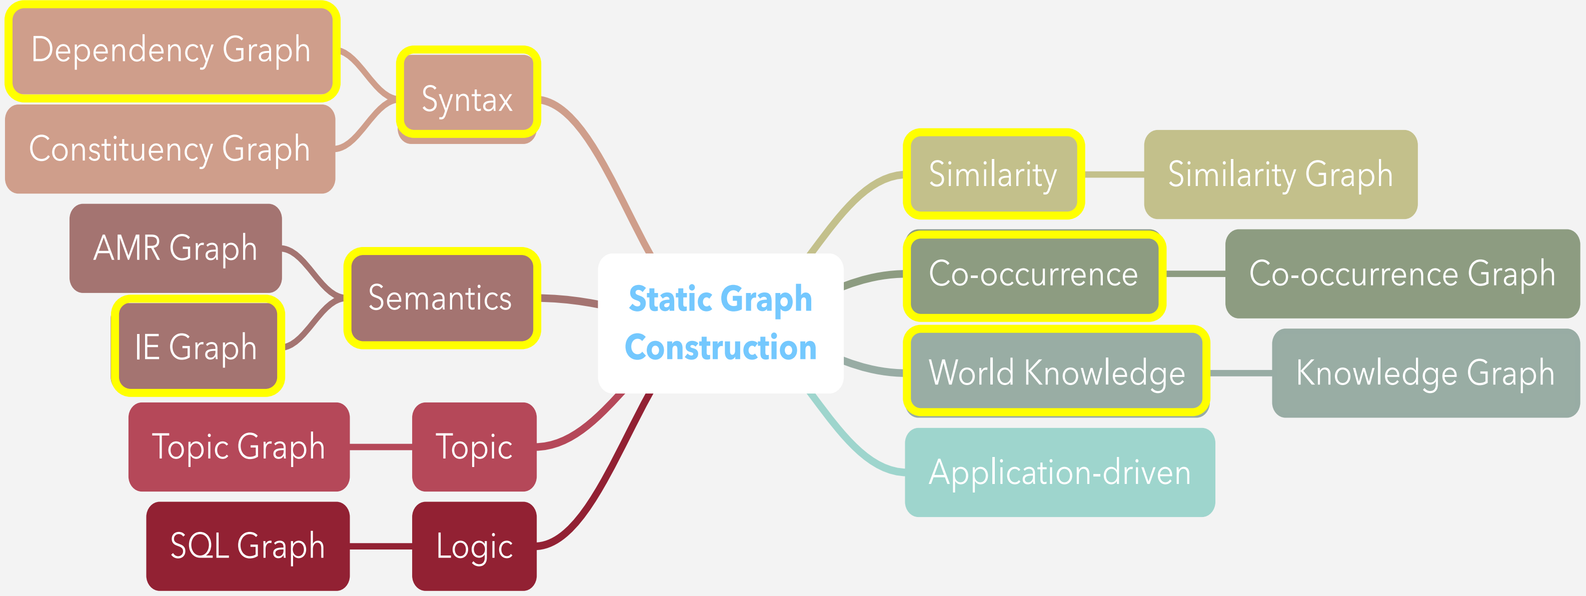
Billy went to ... When he arrived there he saw that all six of the cows were sad and had brown spots . The cows were all eating ...

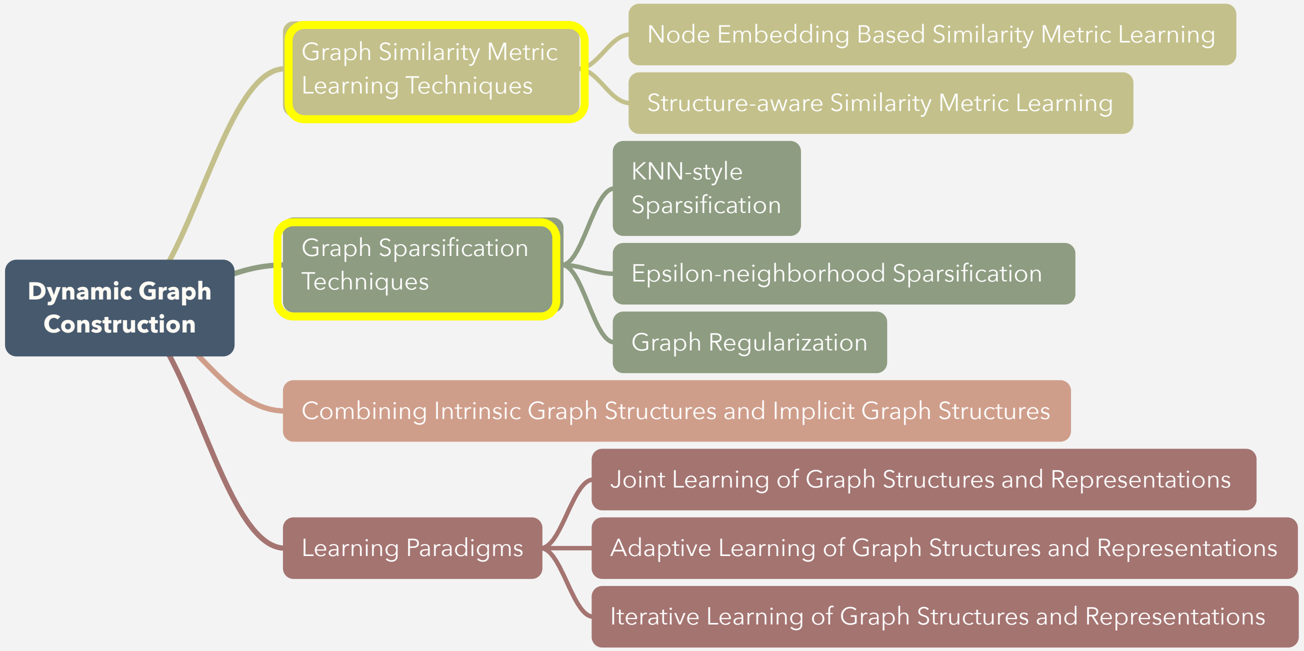
Chen et al. **GraphFlow: Exploiting Conversation Flow with Graph Neural Networks for Conversational Machine Comprehension** IJCAI’20

Summary

GNN enables:

- Multi-hop reasoning
- Encode heterogenous information

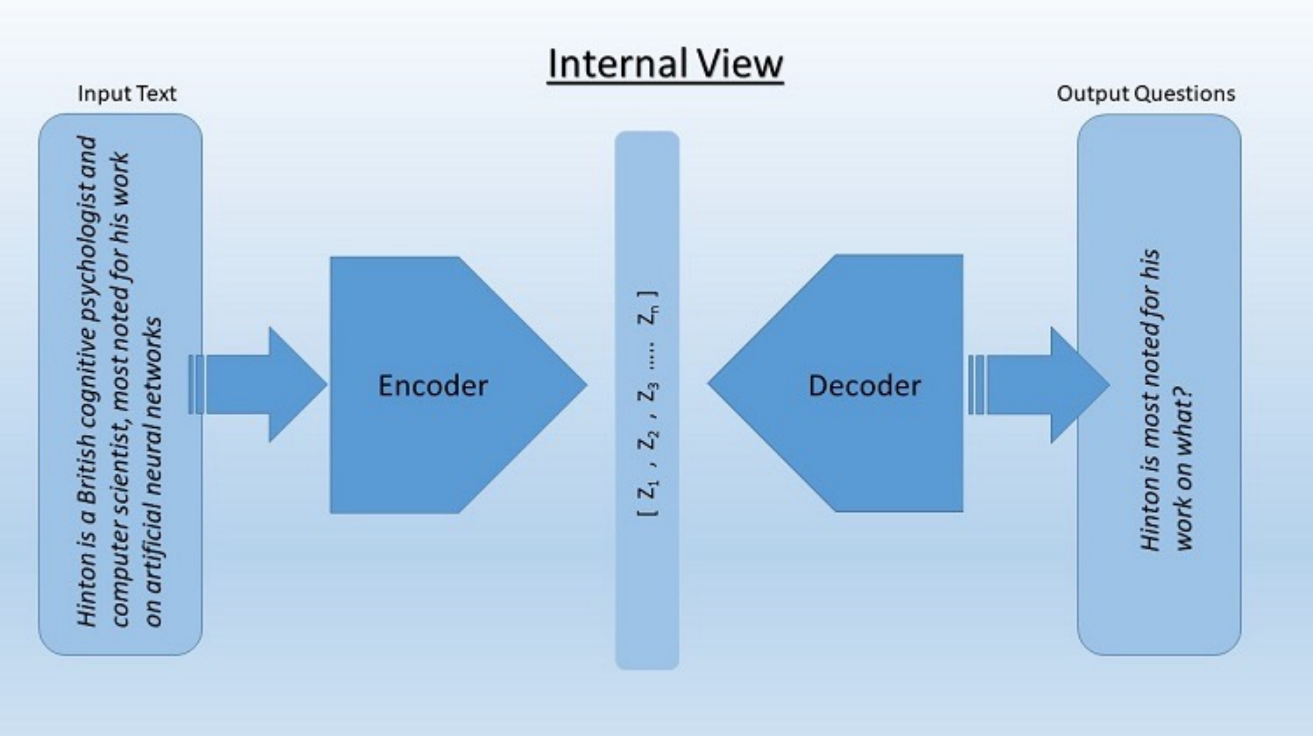




Dynamic Graph Construction
Graph Similarity Metric Learning Techniques
Node Embedding Based Similarity Metric Learning
Structure-aware Similarity Metric Learning
Graph Sparsification Techniques
KNN-style Sparsification
Epsilon-neighborhood Sparsification
Graph Regularization
Combining Intrinsic Graph Structures and Implicit Graph Structures
Learning Paradigms
Joint Learning of Graph Structures and Representations
Adaptive Learning of Graph Structures and Representations
Iterative Learning of Graph Structures and Representations

Natural Language Generation
Machine Translation

Natural Question Generation



Internal View
Input Text
Output Questions
Hinton is a British cognitive psychologist and computer scientist, most noted for his work on artificial neural networks
Encoder
[Z_1 , Z_2 , Z_3 .... Z_n]
Decoder
Hinton is most noted for his work on what?

- Input
  - A text passage $X^p = \{x_1^p, x_2^p, ..., x_N^p\}$
  - A target answer $X^a = \{x_1^a, x_2^a, ..., x_L^a\}$
- Output
  - A natural language question

$$\hat{Y} = \{y_1, y_2, ..., y_T\}$$

which maximizes the conditional likelihood

$$\hat{Y} = \arg\max_Y P(Y|X^p, X^a)$$

Bidirectional GNN performs better

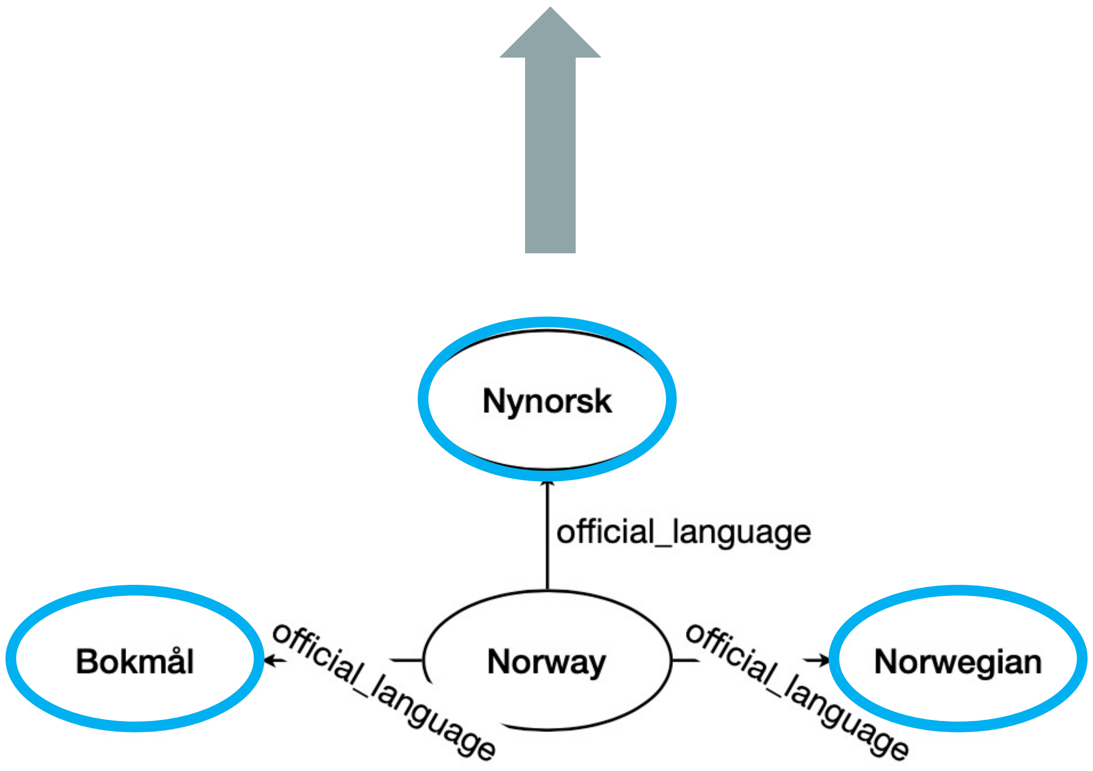
Graph2Seq performs better than Seq2Seq

Ablation study on the SQuAD split-2 test set.

Static graph construction performs slightly better

Natural Question Generation From KG

Q: What languages are spoken in Norway?



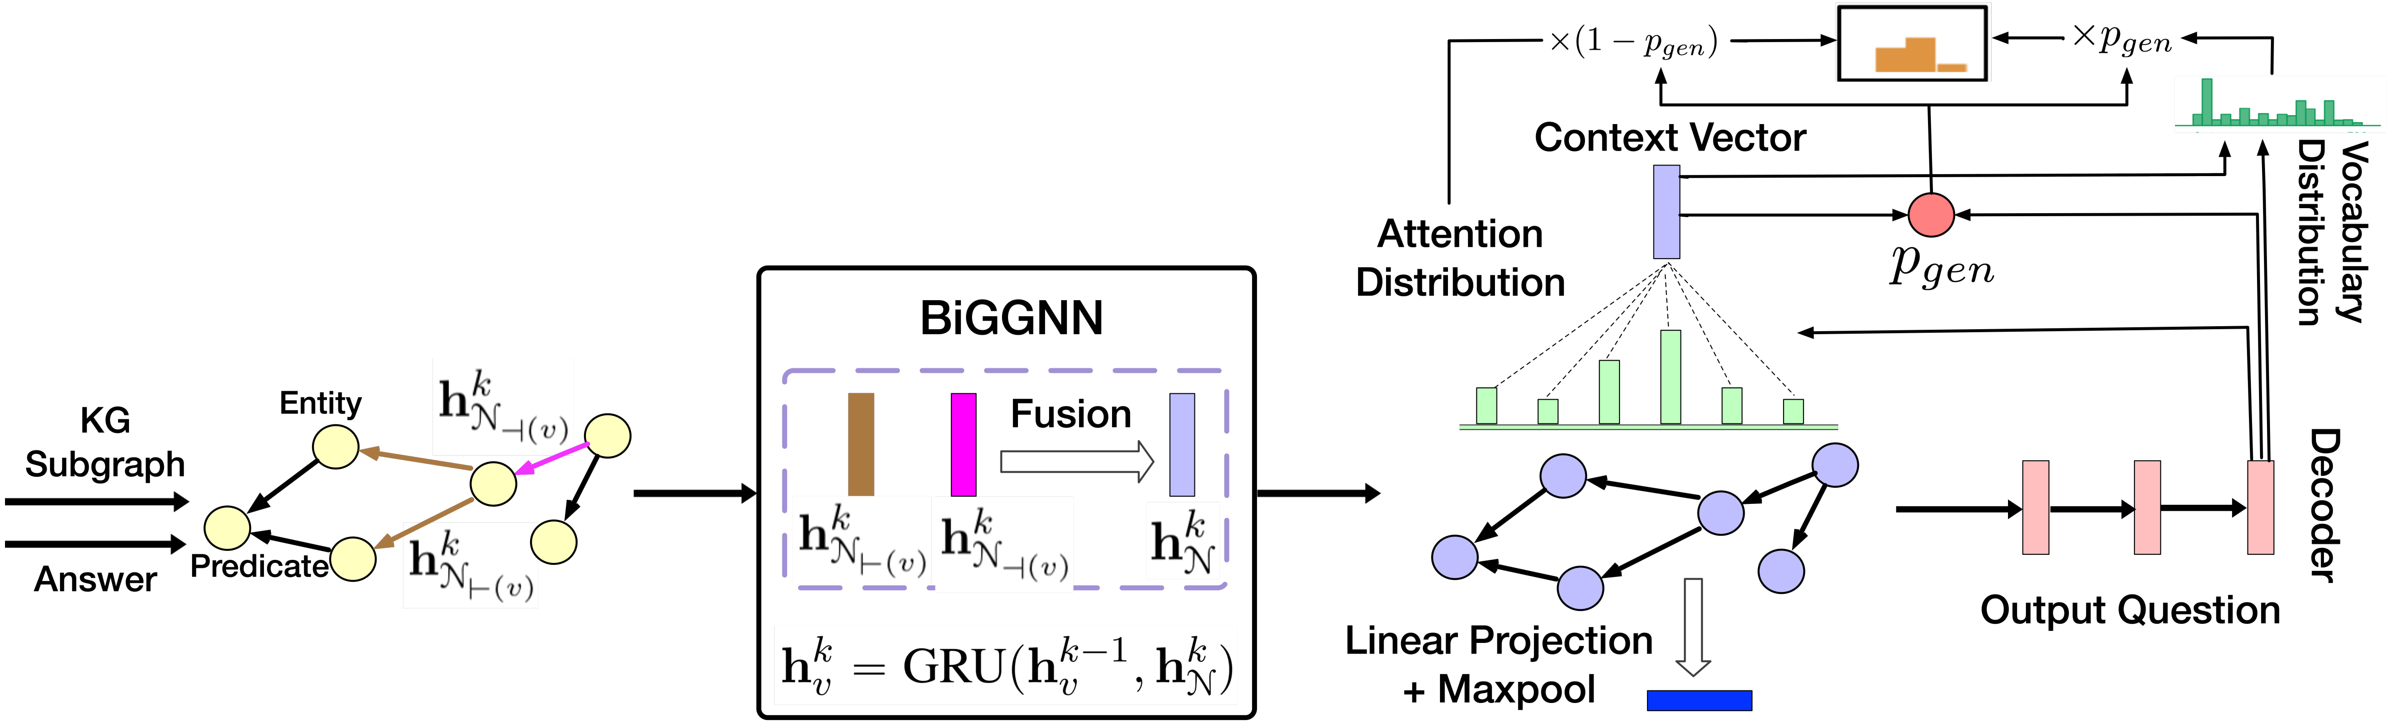
- Input
  - A KG subgraph $\mathcal{G}$ (i.e., a collection of subject-predicate-object triples)
  - A target answer set V^a
- Output
  - A natural language question

$$\hat{Y} = \{y_1, y_2, ..., y_T\}$$

which maximizes the conditional likelihood

$$\hat{Y} = argmax_Y P(Y|\mathcal{G}, V^a)$$

Graph2Seq for QG from KG [Chen et al. arXiv'20]



KG Subgraph
Answer
Entity
Predicate
$\mathbf{h}^k_{\mathcal{N}_{\dashv(v)}}$

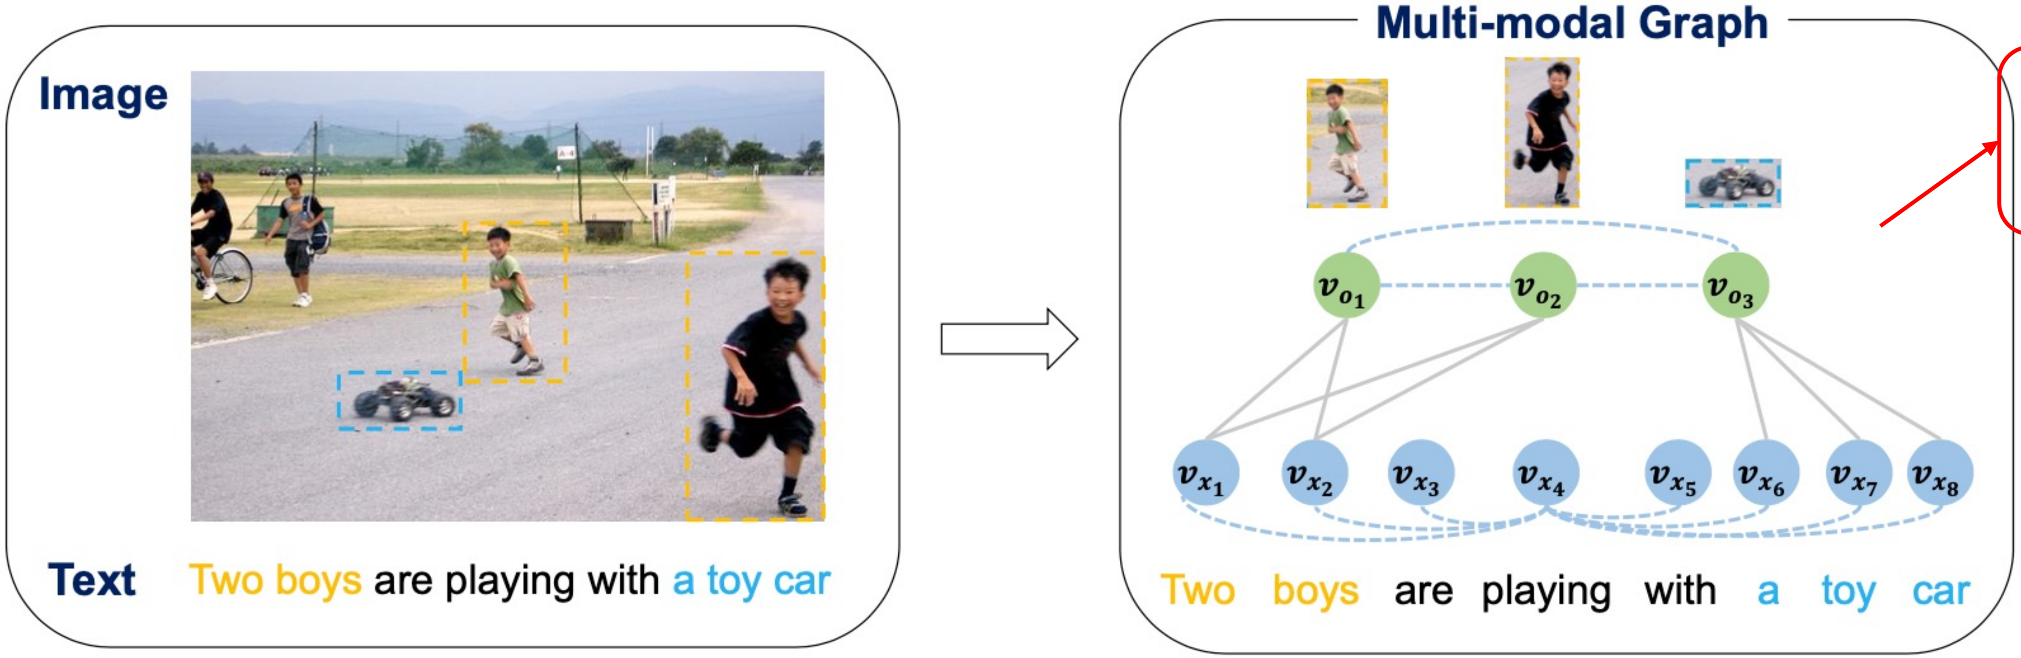
+ GCN	0.3046	38.8	9.6

Test results for English-Czech.

Syntactic GCN is helpful

Multi-modal Machine Translation [Yin et al. ACL’20]



App-driven static graph construction

Figure . The multi-modal graph for an input sentence-image pair. The blue and green solid circles denote textual nodes and visual nodes respectively. An intra-modal edge (dotted line) connects two nodes in the same modality, and an inter-modal edge (solid line) links two nodes in different modalities. Note that we only display edges connecting the textual node “*playing*” and other textual ones for simplicity.

Yin et al. “A Novel Graph-based Multi-modal Fusion Encoder for Neural Machine Translation”. ACL 2020.

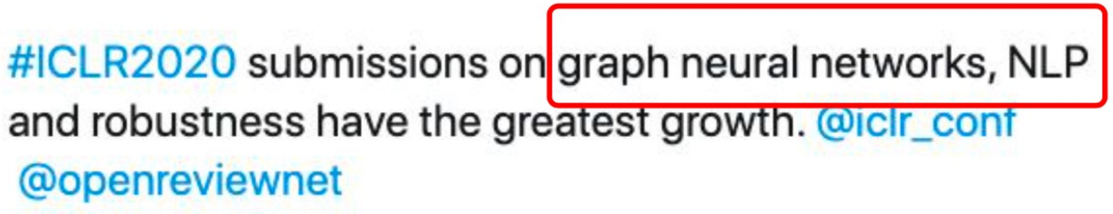
DLG4NLP: Future Directions and Conclusions

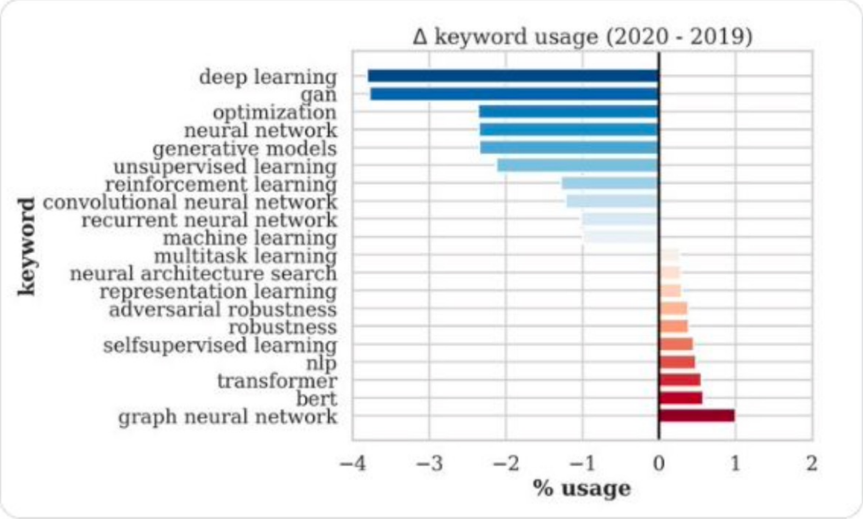
Future Directions

[Vashishth et al. EMNLP’19 Tutorial]

- The Rise of GNN + NLP



#ICLR2020 submissions on graph neural networks, NLP and robustness have the greatest growth. @iclr_conf @openreviewnet



- Graph Construction for NLP
  - Dynamic graph construction are largely underexplored!
  - How to effectively combine advantages of static graph and dynamic graph?
  - How to construct heterogeneous dynamic graph?
  - How to make dynamic graph construction itself scalable?

Future Directions

- Scaling GNNs to Large Graphs
  - Most existing multi-relational or heterogeneous GNNs will have scalability issues when applied to large graphs in NLP such as KGs (> 1m)
- GNNs + Transformer in NLP
  - How to effectively combine the advantages of GNNs and Transformer?
  - Is graph transformer the best way to utilize?
- Pretraining GNNs for NLP
  - Information Retrieval/ Search

Future Directions

- Graph-to-graph Learning in NLP
  - How to effectively develop Graph-to-Graph models for solving graph transformation problem in NLP (i.e. information extraction)?
- Joint Text and KG Reasoning in NLP
  - Joint text and KG reasoning is less explored although GNNs for multi-hop reasoning gains popularity
- Incorporate Source and Context into Knowledge Graph Construction and Verification

Conclusions

- Deep Learning on Graphs for NLP is a fast-growing area today!
- Since graph can naturally encode complex information, it could bridge a gap by combining both empirical domain knowledges and the power of deep learning.
- For a NLP task,
  - how to convert text sequence into the best graph (directed, multi-relation, heterogeneous)
  - how to determine proper graph representation learning technique?
- Our Graph4NLP library aims to make easy use of GNNs for NLP:
  - Code: https://github.com/graph4ai/graph4nlp
  - Demo: https://github.com/graph4ai/graph4nlp_demo
  - Github literature list: https://github.com/graph4ai/graph4nlp_literature
